

2022 ENGINEER SUMMIT

Electrification of Heat is More
Than Just a Fuel Change

November 14, 2022

Agenda

- Introductions
- Heating sources
- Heating loads and coil selection implications
- Carbon emissions and example analysis
- Introduce newer applied heating products
- Overview two chiller heater system concepts
- Summary and final questions

Welcome questions and interaction during the workshop

Hydronic Heating for HVAC: Closed Water System

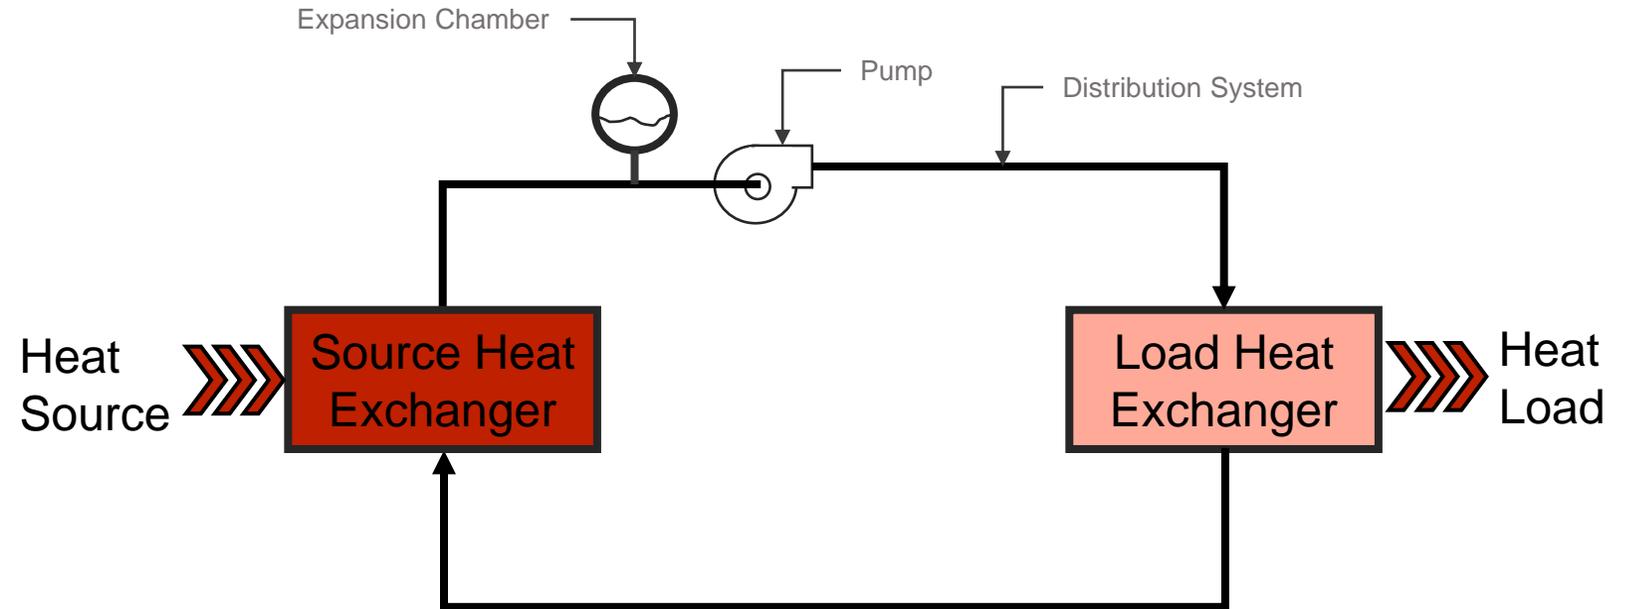

Source and Load Requirements for Hot Water Supply and Return

What is the source of heat making the hot water?

→ Hot Water Temperature + Hot Water Flow Available

What is the load and equipment used?

→ Hot Water Temperature + Hot Water Flow Available

Hydronic Heating for HVAC: Closed Water System

Source and Load Requirements for Hot Water Supply and Return

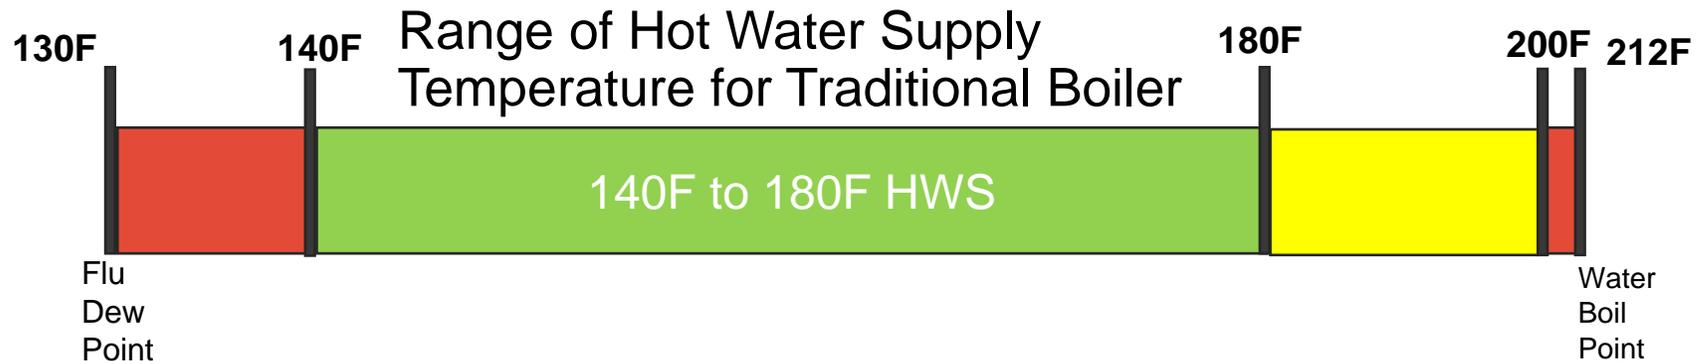

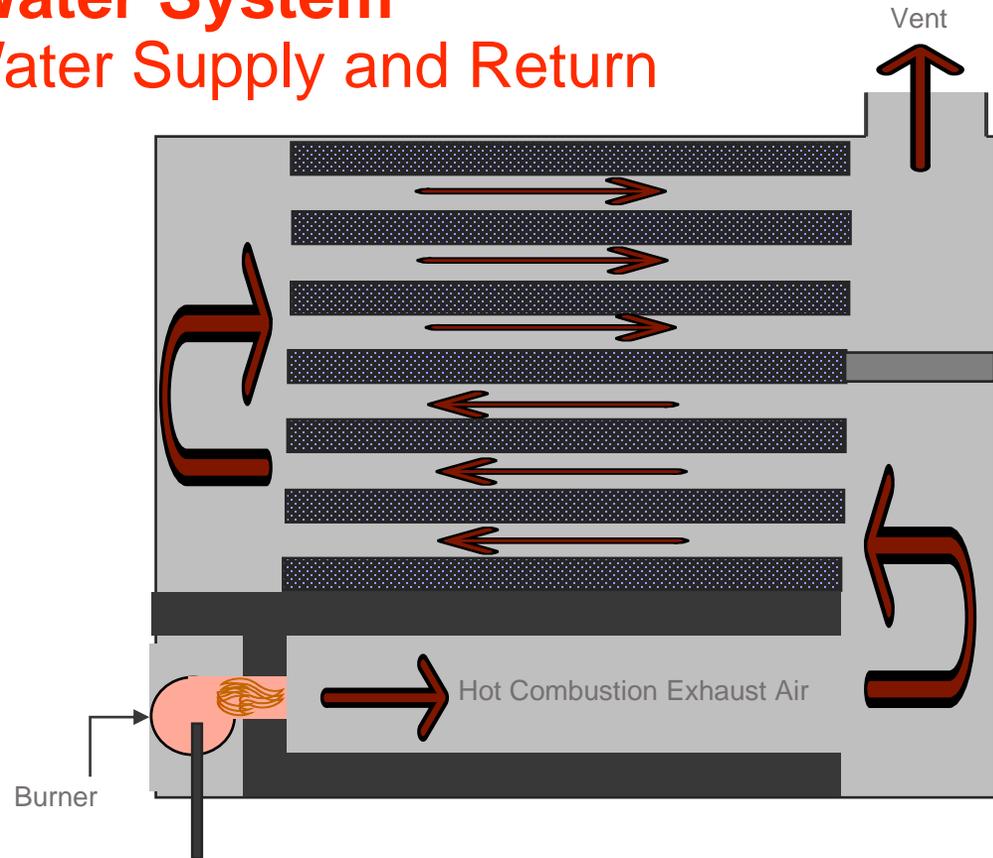

Traditional Boiler

What is the source of heat making the hot water?

Combustion—Make Heat

Natural Gas $\approx 1030 \text{ btu/ft}^3$

Source Heat is combustion exhaust air (flu gas) $\approx 300\text{-}500\text{F}$

Hydronic Heating for HVAC: Closed Water System

Source and Load Requirements for Hot Water Supply and Return

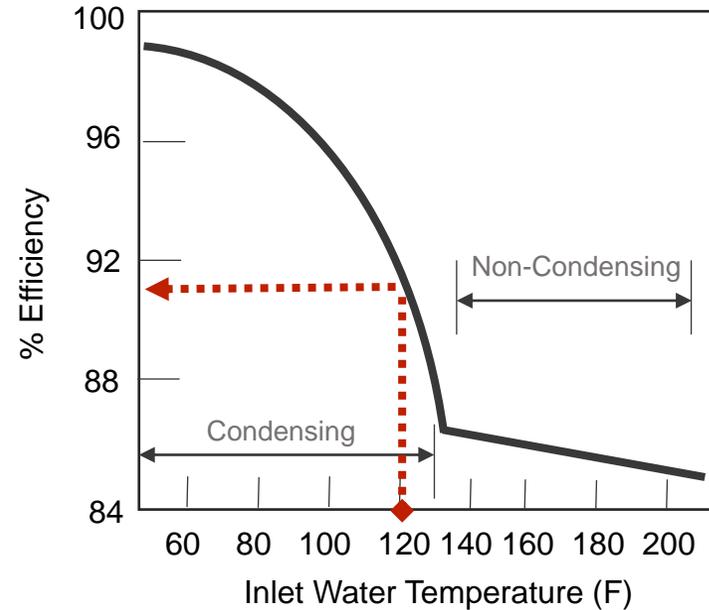

Condensing Boiler

What is the source of heat making the hot water?

Combustion—Make Heat

Natural Gas $\approx 1030 \text{ btu/ft}^3$

Source Heat is combustion exhaust air (flu gas) $\approx 300\text{-}500\text{F}$ + condensation

Range of Hot Water Supply Temperature for Condensing Boiler

130F

140F

<130F HWS

Flu
Dew
Point

<120F Inlet Water to Boiler to get benefit of condensation

ASHRAE® 90.1-2019 Section 6.5.4.8.2

a. Coils and other heat exchangers shall be selected so that at design conditions the hot water return temperature entering boills is 120F or less

Hydronic Heating for HVAC: Closed Water System

Source Requirements for Hot Water Supply and Return

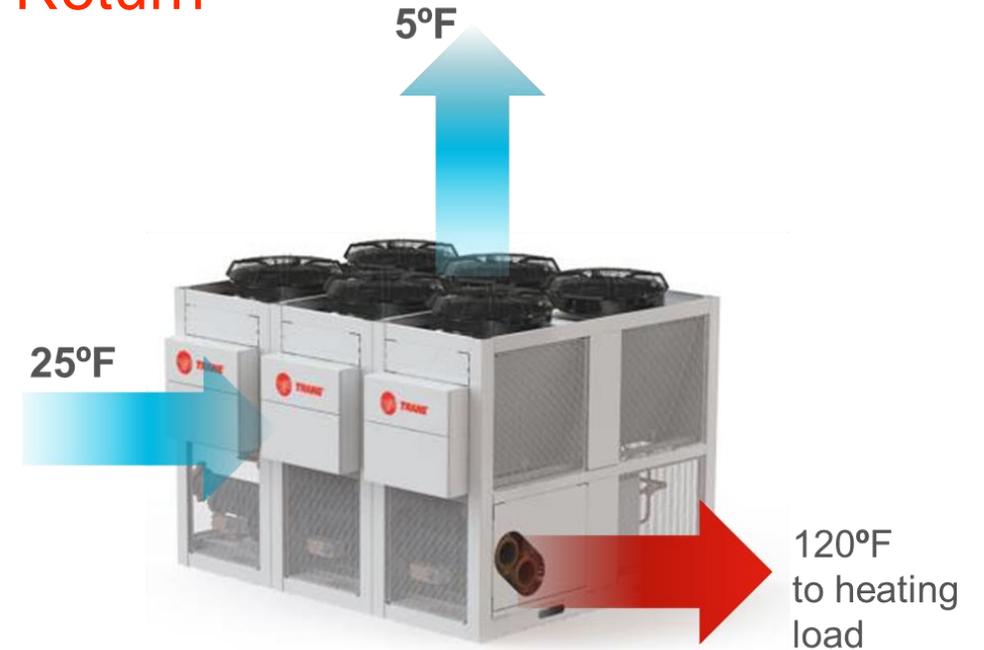

Heat Pumps

What is the source of heat making the hot water?

Heat Pumps- **MOVE** Heat

Source Heat

Air Source: Extract Heat from Outdoor Air

Hydronic Heating for HVAC: Closed Water System

Source Requirements for Hot Water Supply and Return

Air Source Heat Pumps

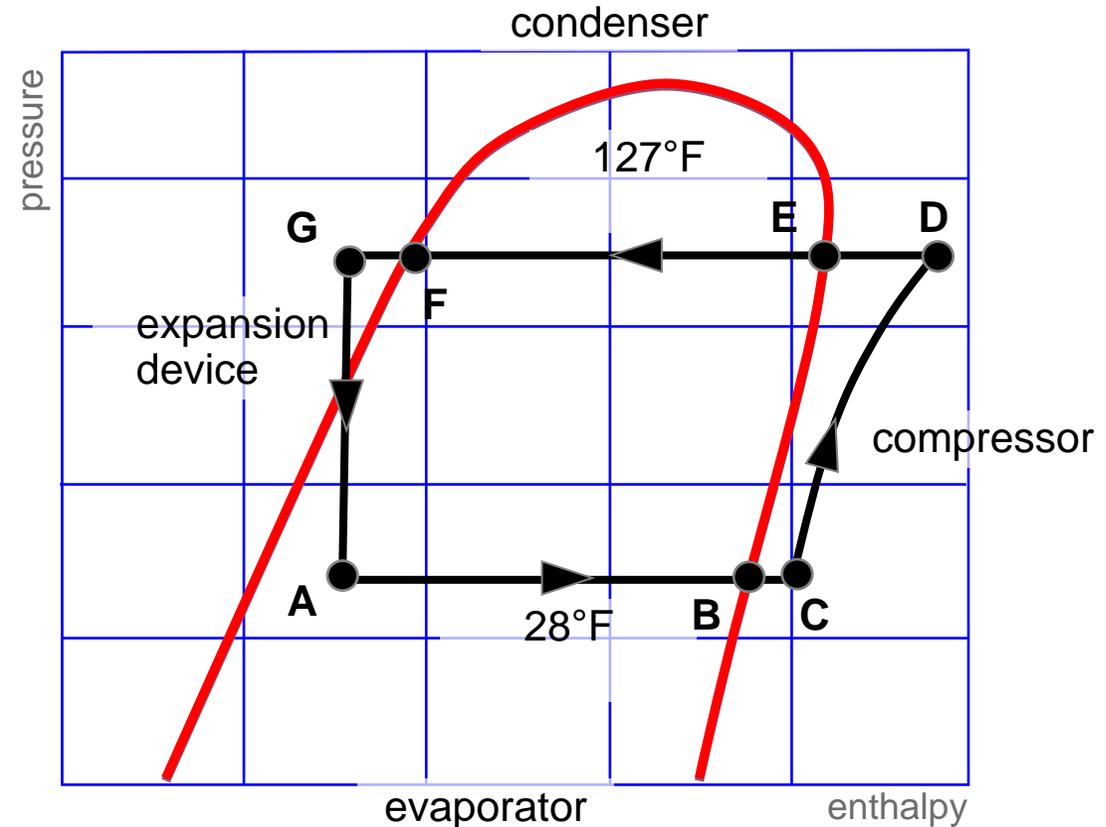

Heat source is outdoor air

Move heat from the outdoor air to the hot water loop for building.

Moving heat is more efficient than making heat COP >> 1.0

Example: 47F ambient conditions
This example, make 120F HW
COP=2.81... 281% efficient

120°F HWS ← [condenser] → 105°F HWR

47F
Outdoor Air

Hydronic Heating for HVAC: Closed Water System

Source Requirements for Hot Water Supply and Return

Air Source Heat Pumps

Heat source is outdoor air

Example: 5F ambient conditions

Colder Air

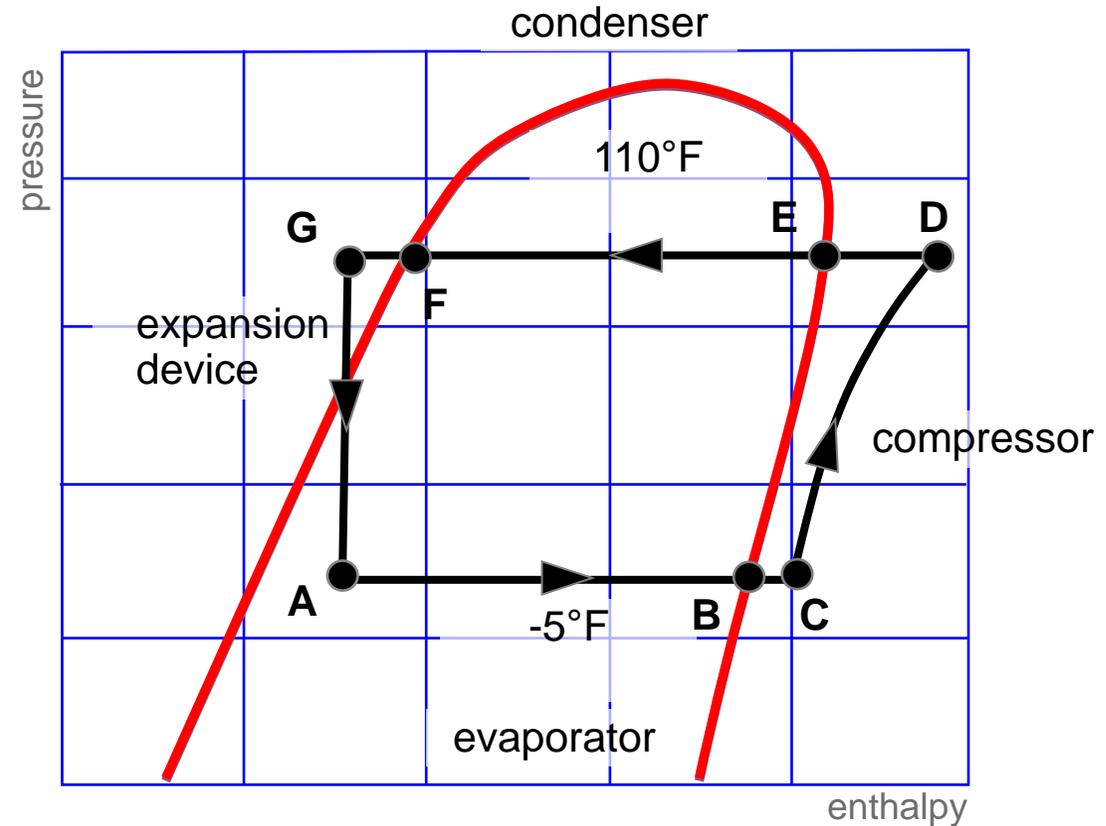

The maximum available temperature hot water is reduced

Available Heating Capacity is reduced

This example, make 105F HW

COP=1.8... 180% efficient

105°F HWS ← —————→ 90°F HWR

5F
Outdoor Air

Hydronic Heating for HVAC: Closed Water System

Source Requirements for Hot Water Supply and Return

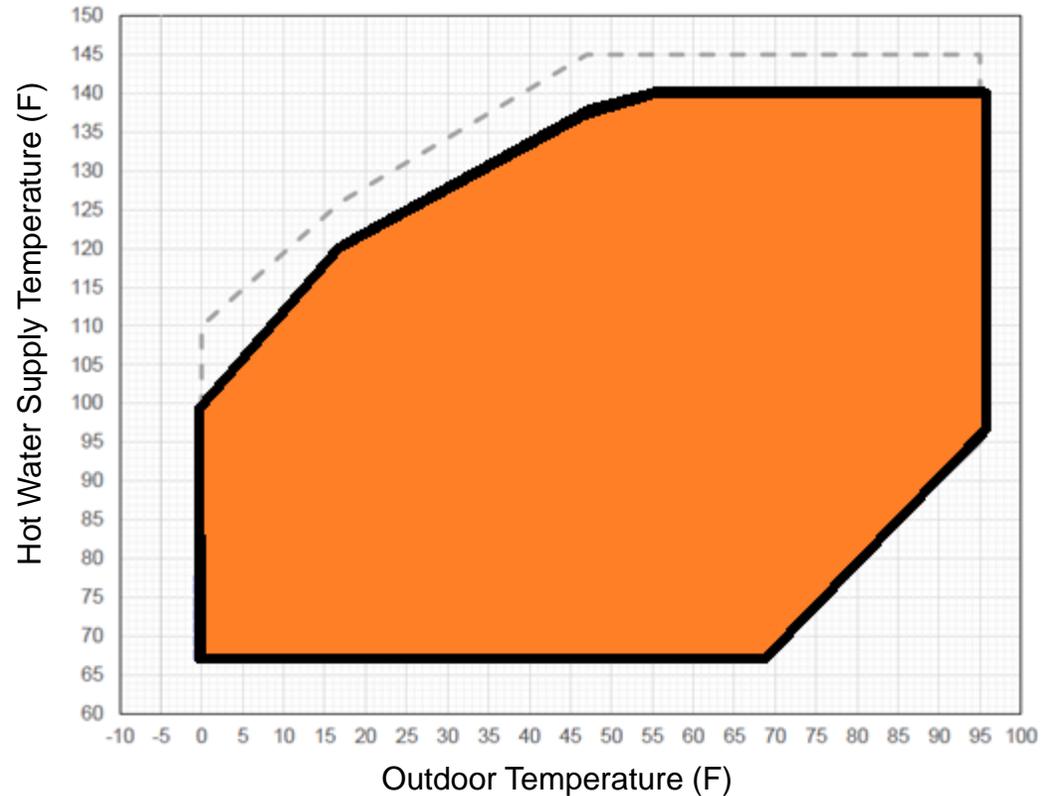

Air Source Heat Pumps

Air Source Heat pump have operating map where the maximum HWS temperature is dependent on the outdoor ambient temperature.

Typical ASHP
HWS 100-140F

Example Operating Map Ascend Heat Pump

140F

<130F HWS

Hydronic Heating for HVAC: Closed Water System

Source Requirements for Hot Water Supply and Return

Heat Pumps

What is the source of heat making the hot water?

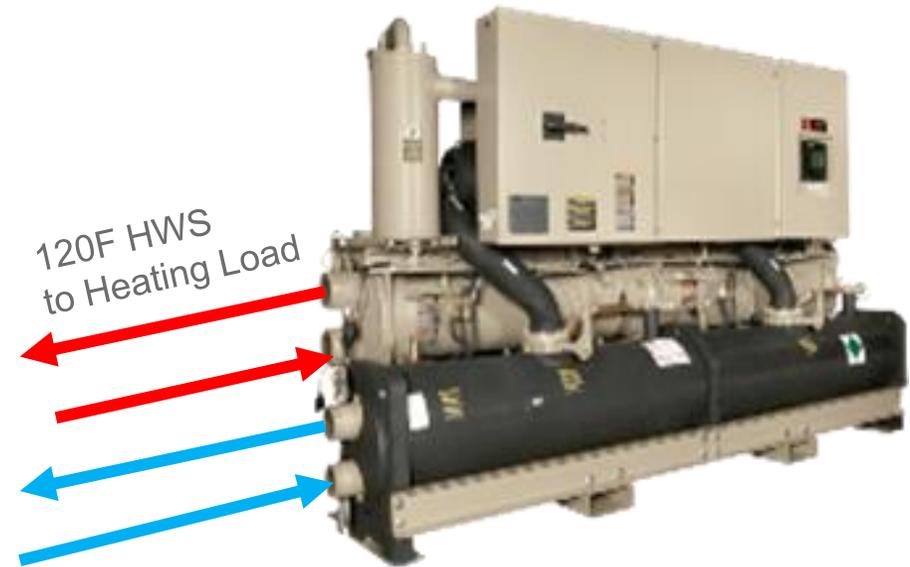

Source Heat

Water Source: Extract Heat from Water Loop

A Building (Chilled Water Loop)

The Earth (Ground Loop)

Thermal Storage(Ice Tanks)

Hydronic Heating for HVAC: Closed Water System

Source Requirements for Hot Water Supply and Return

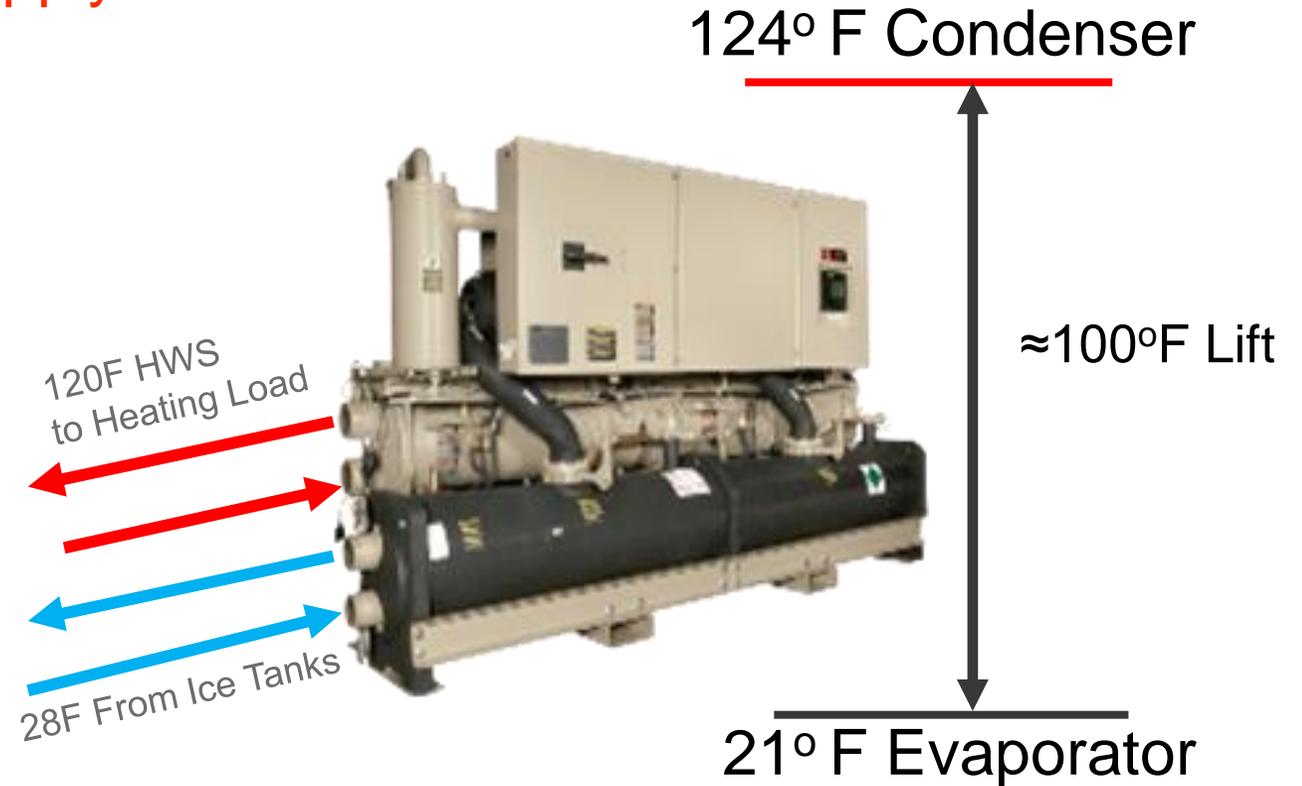

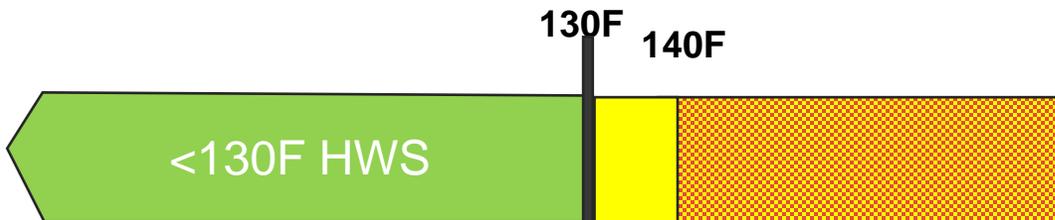

Water Source Heat Pumps

Heat source is water loop

Example: Extract Heat From Thermal Storage Tank

This example, make 120F HW
COP=3.2... 320% efficient

Range of Hot Water Supply Temperature for Water Source Heat Pump

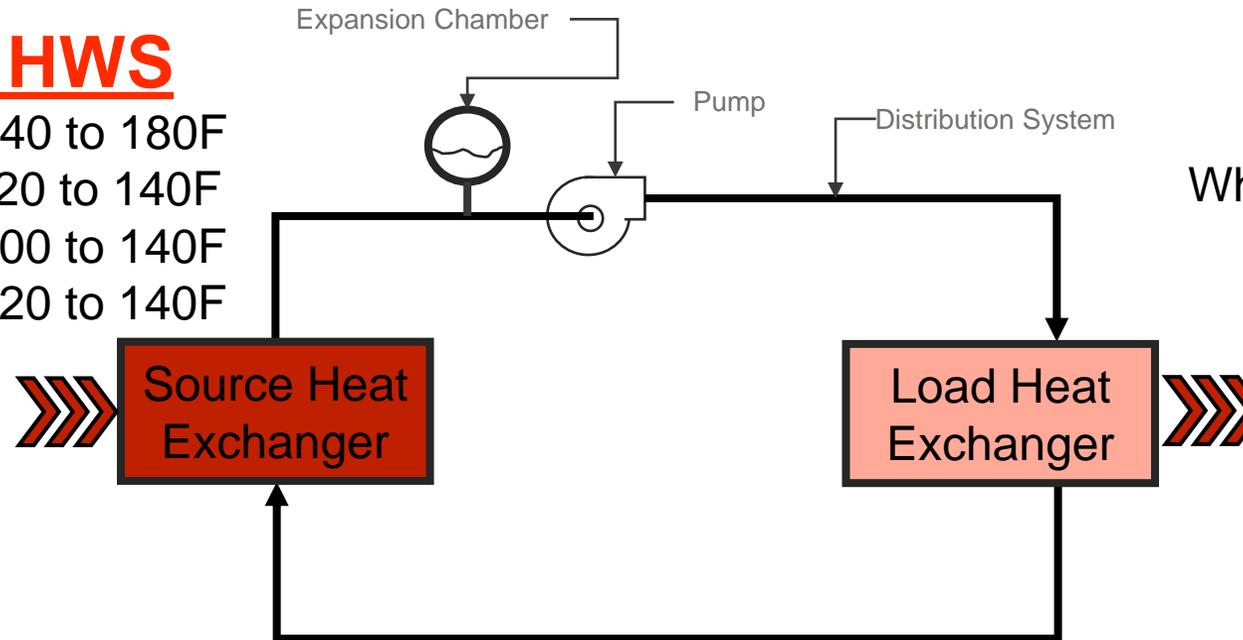

Hydronic Heating for HVAC: Closed Water System

Source Requirements for Hot Water Supply and Return

Typical MAX HWS

Traditional Boiler =140 to 180F
Condensing Boiler =120 to 140F
ASHP =100 to 140F
WSHP =120 to 140F

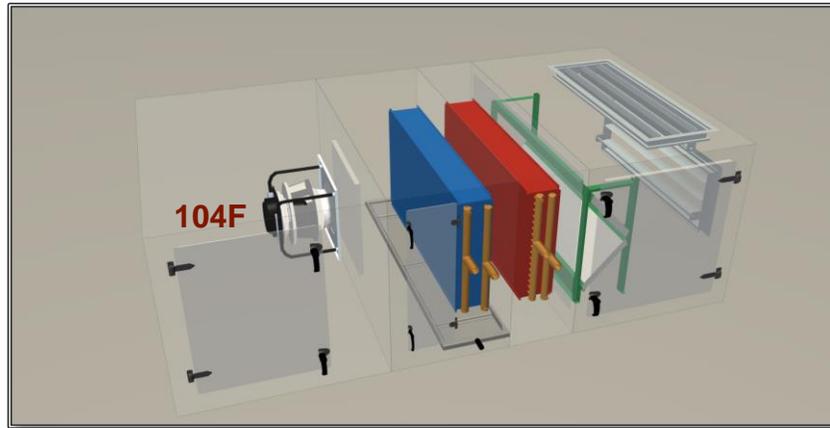

Required HWS

What Does the Load Require?

Hydronic Heating for HVAC: Closed Water System

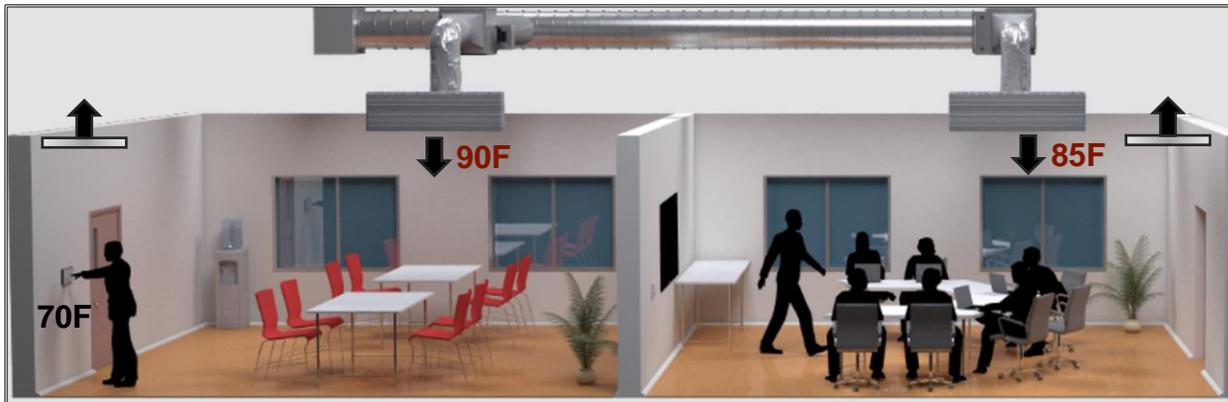

Load Requirements for Hot Water Supply and Return

supply air temperature limits

Draw Thru fans

- UL limit of 104F air for motor
- More critical today for units with ECM fans

Ceiling Return and Supply

ASHRAE® 62.1 ventilation requirements

Supply air needs to be <15F from space set point or 20% more outdoor air needed!

Design Set points typically 68-70F

Max Supply to avoid penalty 83-85F

ASHRAE 90.1 zone reheat maximum

Supply air < 20F from space setpoint

Max Supply 88-90F

Hydronic Heating for HVAC: Closed Water System

Load Requirements for Hot Water Supply and Return

supply air temperature limits

Comfort ASHRAE® STD 55

Sitting occupants need less than 5.4F between head and ankle air temperature

Standing occupants need less than 7.2F between head and ankle air temperature

Operative temperature of space can not rise quicker than 2F in 15minutes

These are difficult to accomplish with very hot air

Hydronic Heating for HVAC: Closed Water System

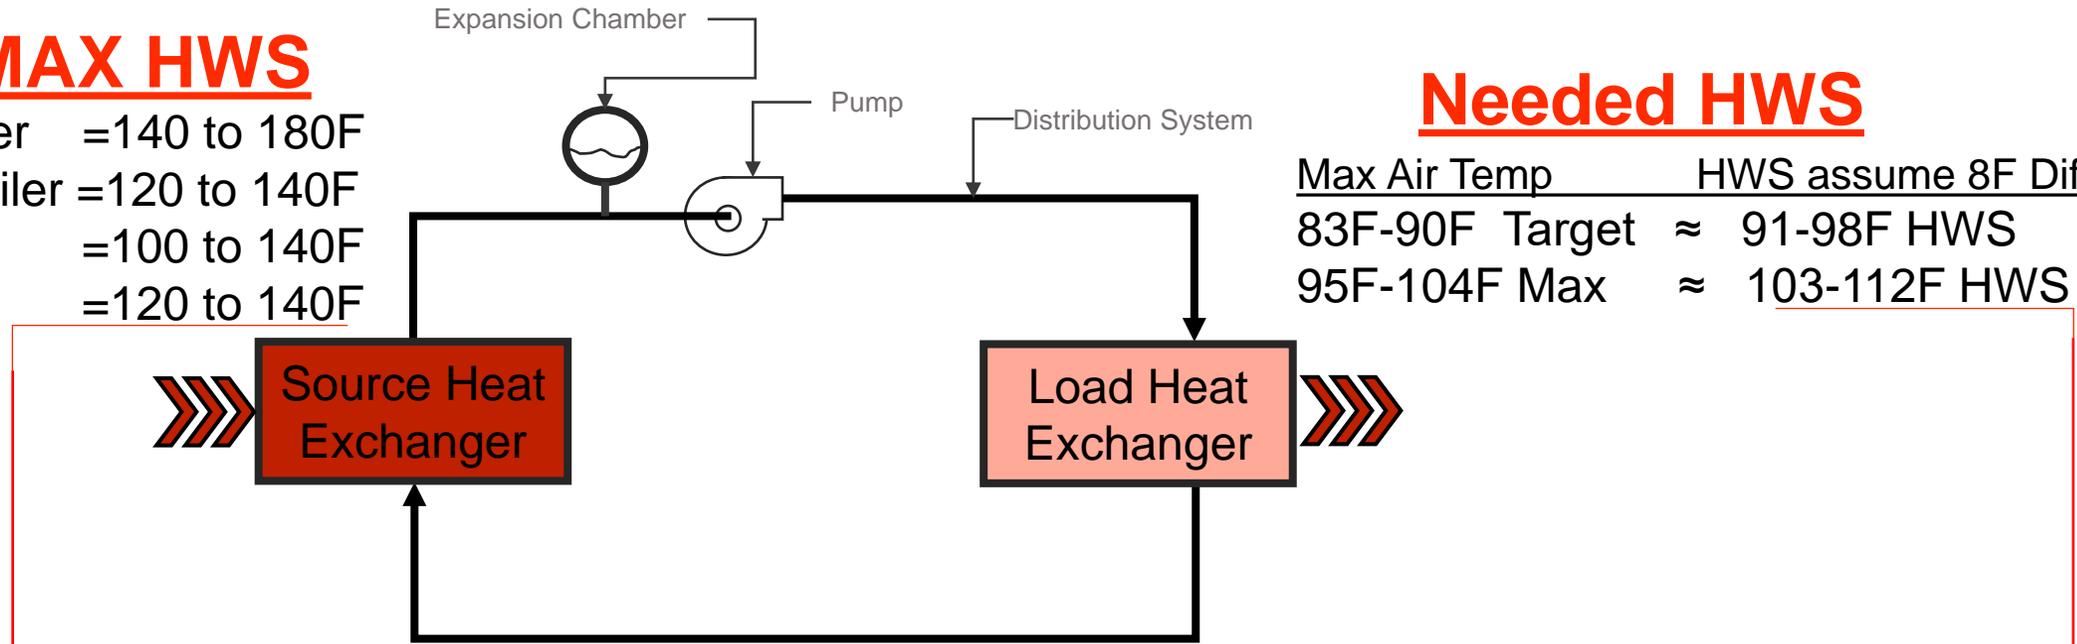

Source Requirements for Hot Water Supply and Return

Typical MAX HWS

Traditional Boiler =140 to 180F
 Condensing Boiler =120 to 140F
 ASHP =100 to 140F
 WSHP =120 to 140F

Needed HWS

Max Air Temp	HWS assume 8F Diff
83F-90F Target	≈ 91-98F HWS
95F-104F Max	≈ 103-112F HWS

New Buildings or New Systems
 HWS temperature to match load

Reuse existing coils
 HWS to match the coils

Hydronic Heating for HVAC: Closed Water System Load Requirements for Hot Water Supply and Return

Example: Fan Coil Unit

Heating Return Air Only

EAT 65F LAT 90F

Hot-water supply temperature	180°F	140°F	110°F	105°F
Coil rows	1 (HW)	2 (HW)	2 (HW)	4
Entering fluid temperature, °F	180	140	110	105
Leaving fluid temperature, °F	103	93	103	82

Unit coil face area sized for cooling

-1Row Heating coil HWS =180F

-2Row Heating coil HWS =110 to 140F

-4Row Heat/Cool coil HWS =100 to 110F

Reusing Existing Coils

180F HWS coils are a mismatch to required supply air temp

- **Reduced Size Heat exchanger are used**
 - Coils often are not full face
 - Minimum Fin Spacing possible
- **More water flow at lower temperatures will not get design capacity**

140F HWS coils may work at design with 120-130F HWS but would require more flow.

Hydronic Heating for HVAC: Closed Water System

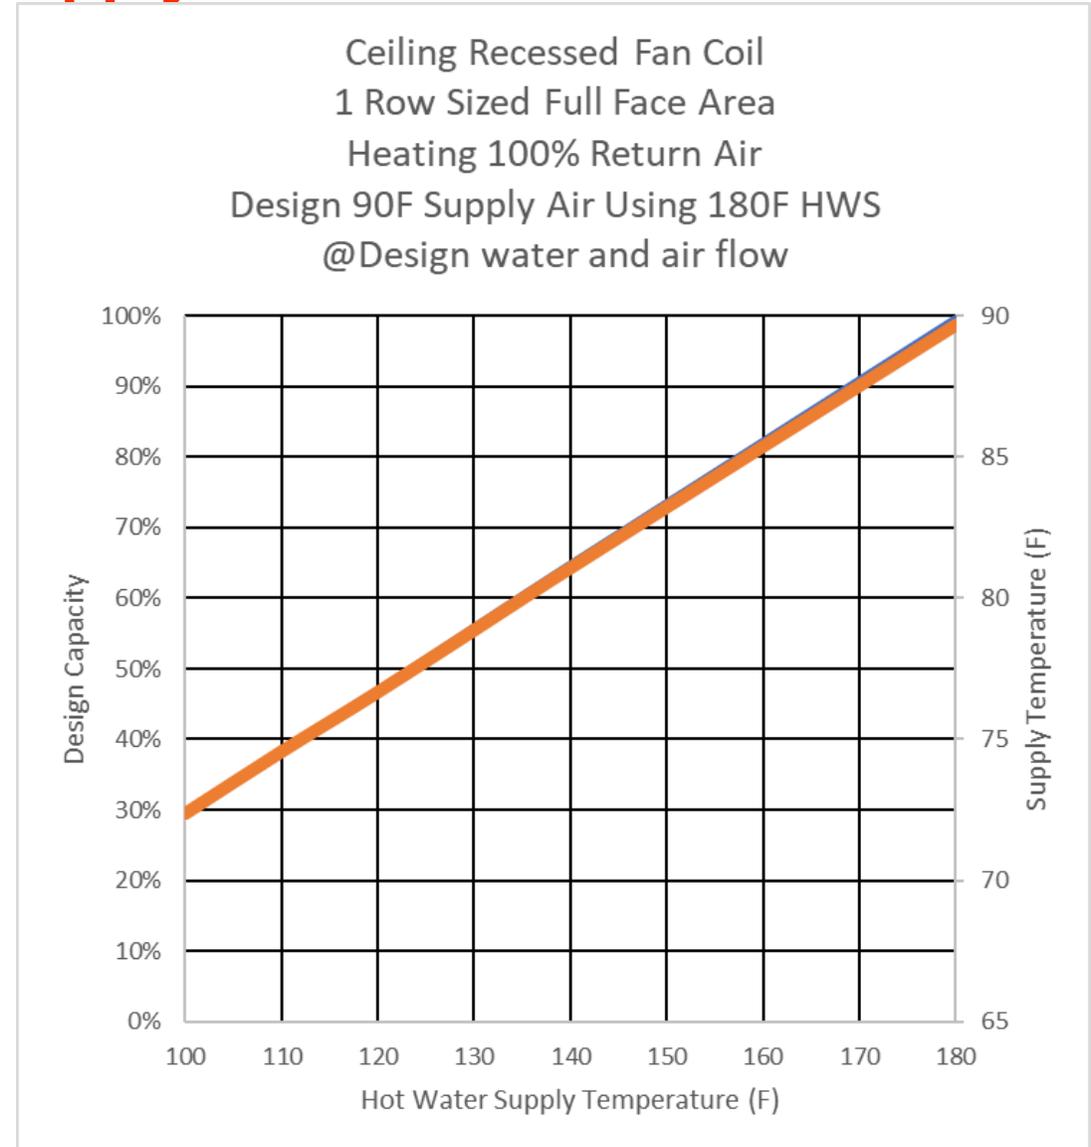

Source Requirements for Hot Water Supply and Return

How Much Capacity Can Get trying to reuse equipment sized for traditional boiler?

- Hundreds of equipment types
- Each with multiple coils and fin options
- Need water flow and close current match of equipment to select for estimate

This is an example....no “typical” !!!

Here 120F get 50% capacity in coil sized for 180F

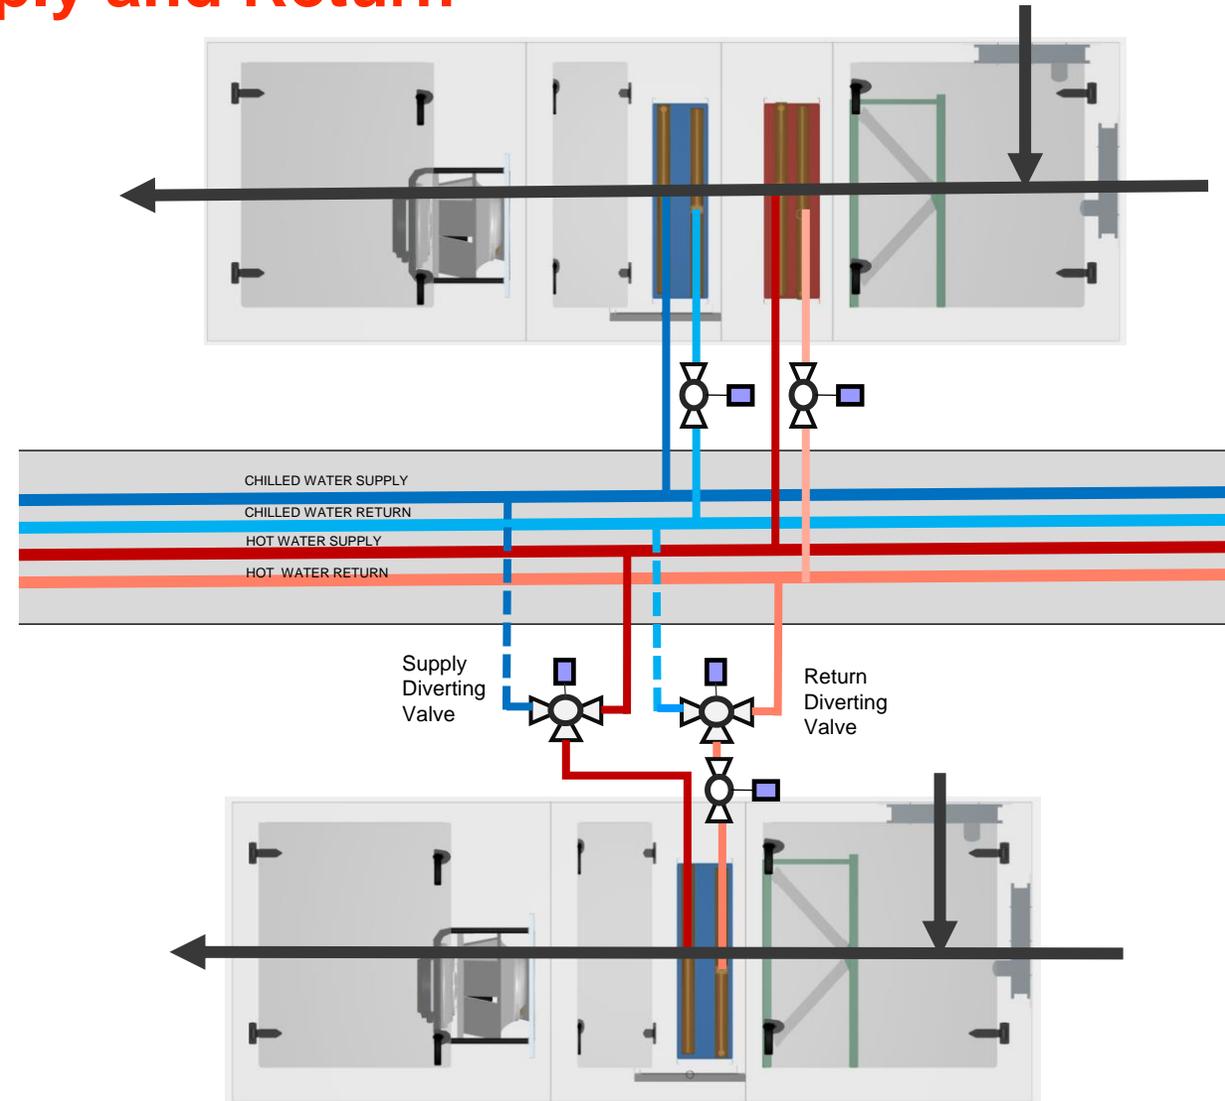

Hydronic Heating for HVAC: Closed Water System

Load Requirements for Hot Water Supply and Return

MIXED AIR SINGLE ZONE AHU

- 50F mixed air heated to 90F LAT
 - 2 Row Heating Coil HWS= 140F to 180F
 - 4 Row Heating Coil HWS= 100F to 110F
 - 0 Row Heating Coil HWS= 100F to 105F

Hot-water supply temperature	180°F	140°F	105°F
Coil rows	2 (HW) 6 (CHW)	2 (HW) 6 (CHW)	4 (HW) 6 (CHW)
Coil heating capacity, Btu/h	86,800	86,800	86,800
Entering fluid temperature, °F	180	140	105
Leaving fluid temperature, °F	150	120	85
Fluid flow rate, gpm	5.78	8.7	8.7
Fluid pressure drop, ft. H ₂ O	0.05	0.29	1.0
Airside pressure drop in. H ₂ O	0.13 (HW) 0.53 (CHW)	0.17 (HW) 0.53 (CHW)	0.39 (HW) 0.53 (CHW)

Hydronic Heating for HVAC: Closed Water System

Load Requirements for Hot Water Supply and Return

4 pipe distribution system

NOT CHANGEOVER SYSTEM

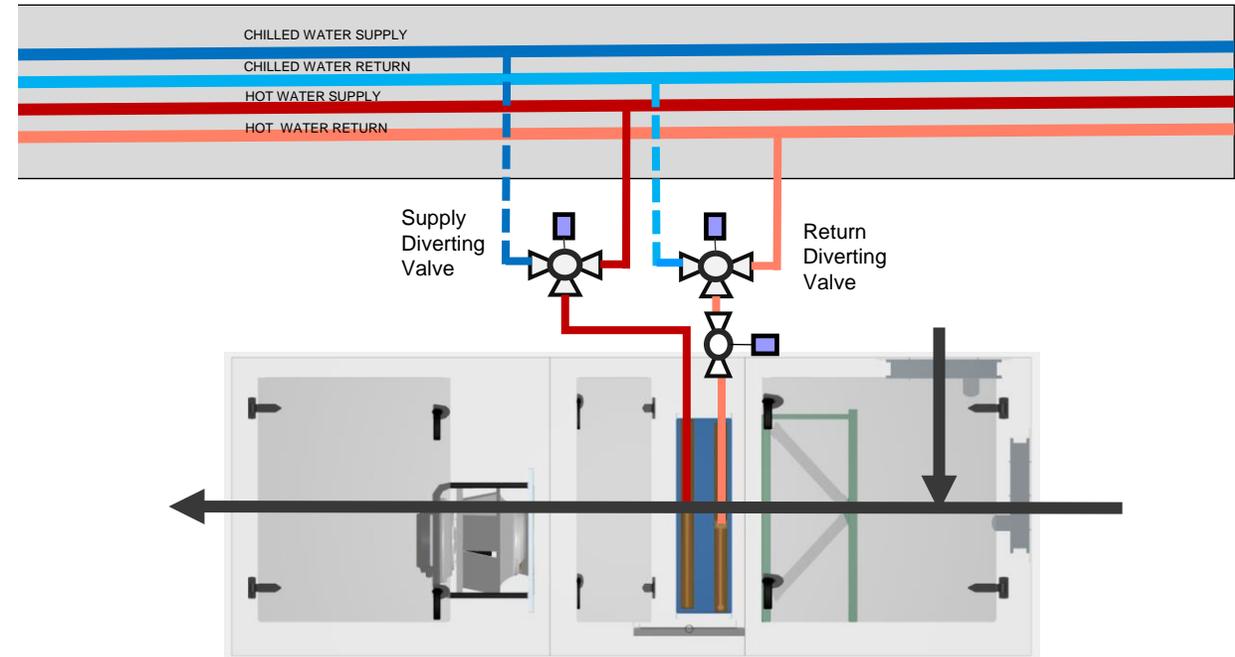

Same as air cooled chiller + boiler

Simultaneous heat and cool system

Changeover Coil

Same Coil used for heating and cooling

Why Changeover coils now work

Air Cooled Chiller + Boiler

Air Source Heat Pump

- same machines used to heat and cool
- same fluid used to heat and cool
- heating fluid not too hot to use in cooling coil

Hydronic Heating for HVAC: Closed Water System

Load Requirements for Hot Water Supply and Return

DOAS UNIT

DOAS Coils HWS= 70F to 85F

Example: BLOWER COIL

100% OA @ 10F

Heated to 99F

105F HWS $\Delta T=29F$

Unit Overview

Model Number	Design Airflow	Elevation	External Dimensions			Weight	
			Length	Width	Height	Shipping	Operating
BCHE036	1200 cfm	0.00 ft	56.700 in	42.000 in	17.000 in	181.0 lb	298.0 lb

Coil Information

Coil #1	8R Auto Changeover	Cooling face velocity	450 ft/min
		Heating face velocity	450 ft/min
		Cooling fluid type	Water
		Motor heat calculation	Ignore

Coil Performance - Cooling

Total cooling capacity	100.25 MBh	Cooling ent fluid temp	42.00 F
Sensible capacity	54.30 MBh	Cooling leaving fluid temp	66.99 F
Cooling EDB	95.00 F	Cooling delta T	24.99 F
Cooling EWB	78.00 F	Cooling flow rate	8.00 gpm
Cooling LDB	54.36 F	Cooling fluid PD	7.31 ft H2O
Cooling LWB	54.26 F	Piping package PD	17.53 ft H2O
		Fluid velocity	2.00 ft/s
		APD	1.042 in H2O

Coil Performance - Changeover Heating

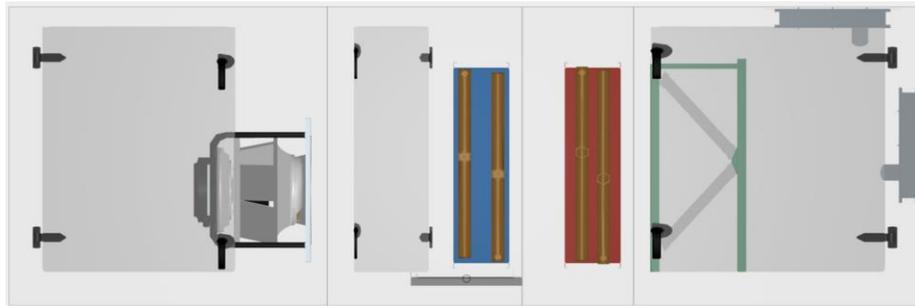

Total heating capacity	116.10 MBh	Heating delta T	29.09 F
Heating EAT	10.00 F	Main heating flow rate	8.00 gpm
Heating LAT	99.21 F	Heating fluid velocity	2.00 ft/sec
Heating ent fluid temp	105.00 F	Main heating fluid PD	6.73 ft H2O
Heating leaving fluid temp	75.91 F		

Hydronic Heating for HVAC: Closed Water System Load Requirements for Hot Water Supply and Return

MULTIPLE ZONE VAV SYSTEM

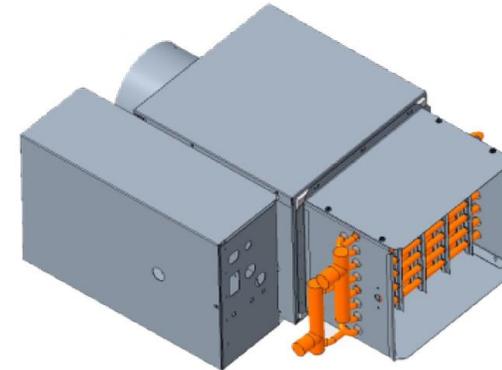

CENTRAL VAV AIR HANDLER

1 Row Coil = 100F to 180F HWS

VAV SERIES BOX

- 1 Row HWS= 180F
- 2 Row HWS= 140F
- 3 Row HWS= 105-110F
- 4 Row HWS= 100-105F

Hydronic Heating for HVAC: Closed Water System Requirements for Hot Water Supply and Return

Boilers and Heat Pump have different hot water supply temperature limitations

- **Traditional Boilers Have lower limits >>140F HWS**
- **Condenser Boilers Have upper limits < 130F HWS**
- **Air Source Heat Pumps**
 - Limits change with outdoor air conditions and models
 - Source available capacity is not limited
 - Today's typical range HWS 100-130F
- **Water Source Heat Pumps**
 - Limits does not change with outdoor air conditions, from source water temp
 - Source available capacity has a limit
 - Today's typical range HWS 120-140F

Change over coils in the airside equipment benefits heat pump systems

HVAC Heating Systems can condition buildings with 100 to 110F Hot water

- **Most new systems will have heat pump and airside equipment selected in that range**

Reusing airside equipment and heating coils sized using boiler hot water supply is not a swap out

- **Existing airside equipment will drive required HWS temperature**
 - 180F HWS size coils have limited heat exchanger capacity and will only provided limited capacity at lower HWS
 - 140F HWS size coils may work at design with 120-130F HWS but more flow will be required.

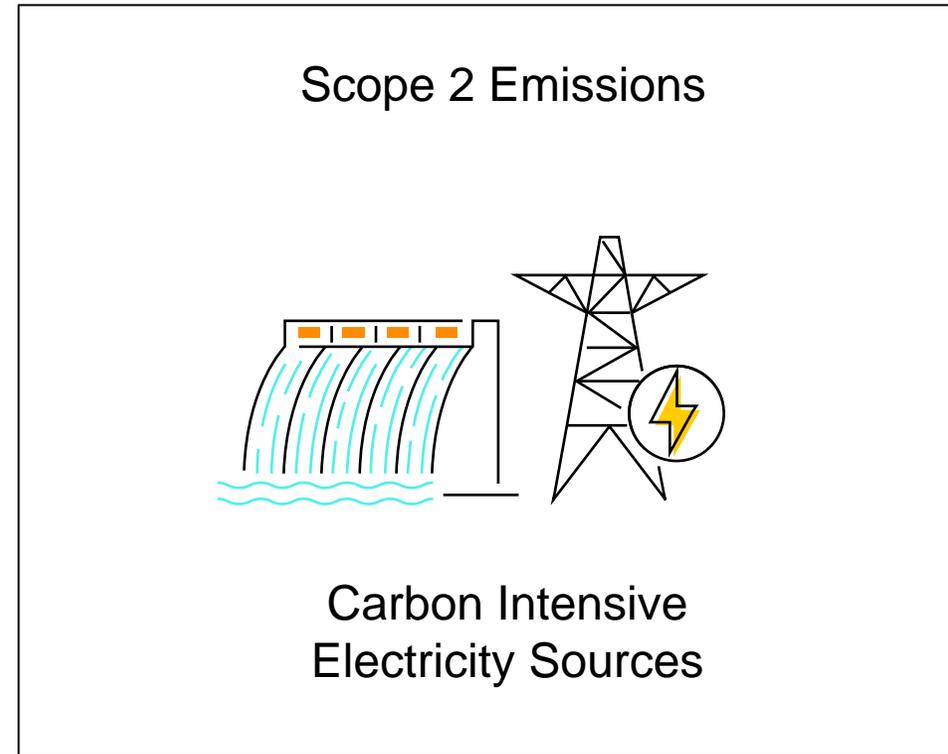

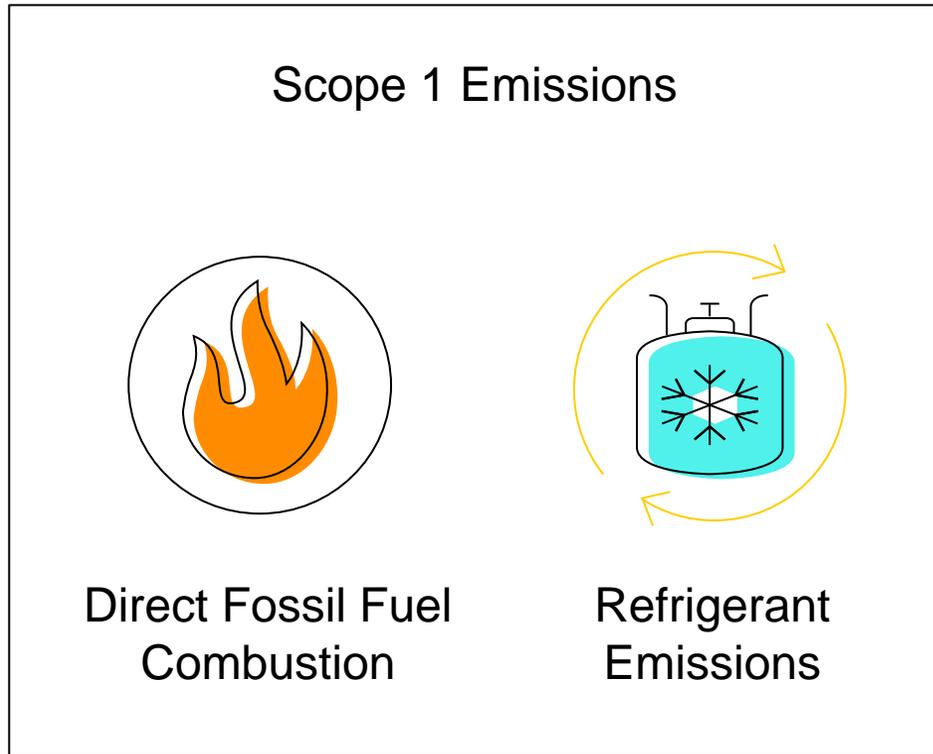

TRANE

Carbon Equivalent Emissions

Where Are Emissions Generated From?

Operational Emissions

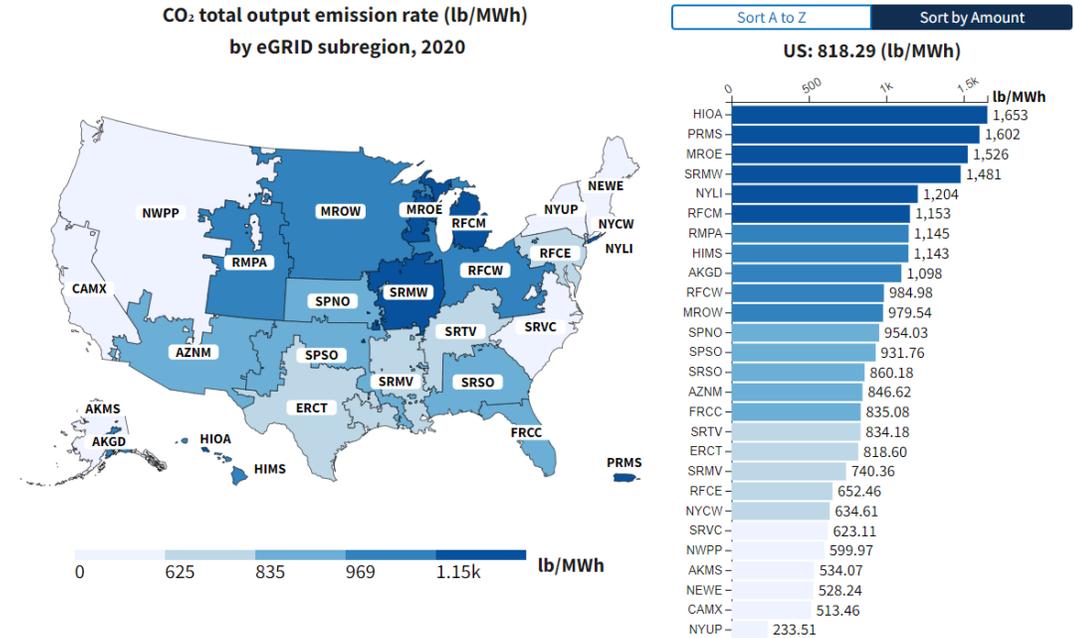

Source: Greenhouse Gas Protocol

Operational Carbon Emissions

- Fuel
 - Natural Gas: 399 lbs/MWH
 - 90% efficient gas boiler, 443 lbs/MWH
 - Electricity (national average): 818 lbs/MWH
 - Resistance (2022 eGrid), 234 – 1653 lbs/MWH
- Efficiency
 - Heat pumps
 - Heating COP range 1.5 – 4.0
 - Cooling efficiency is slightly reduced
- Refrigerant
 - R-410a: 2088 GWP
 - R-32: 675 GWP
 - R-454B: 466 GWP

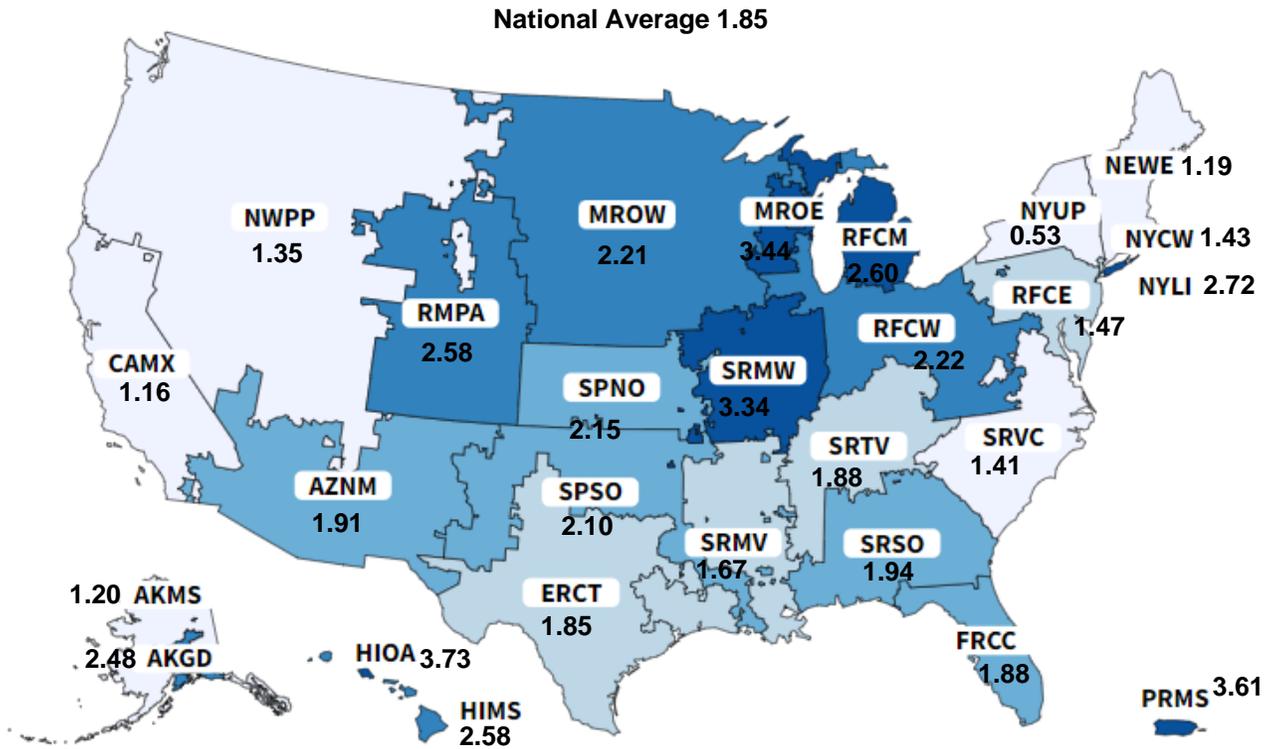

2020 eGRID CO₂e Breakeven Heating COP

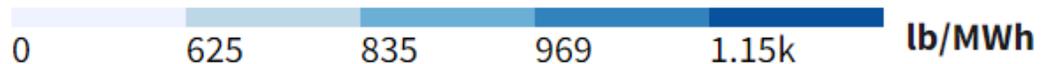

CO₂ total output emission rate (lb/MWh)
by eGRID subregion, 2020

Breakeven Heating COP:
The minimum electrified heat source COP required to equal a 90% efficient gas boiler CO₂e emissions.

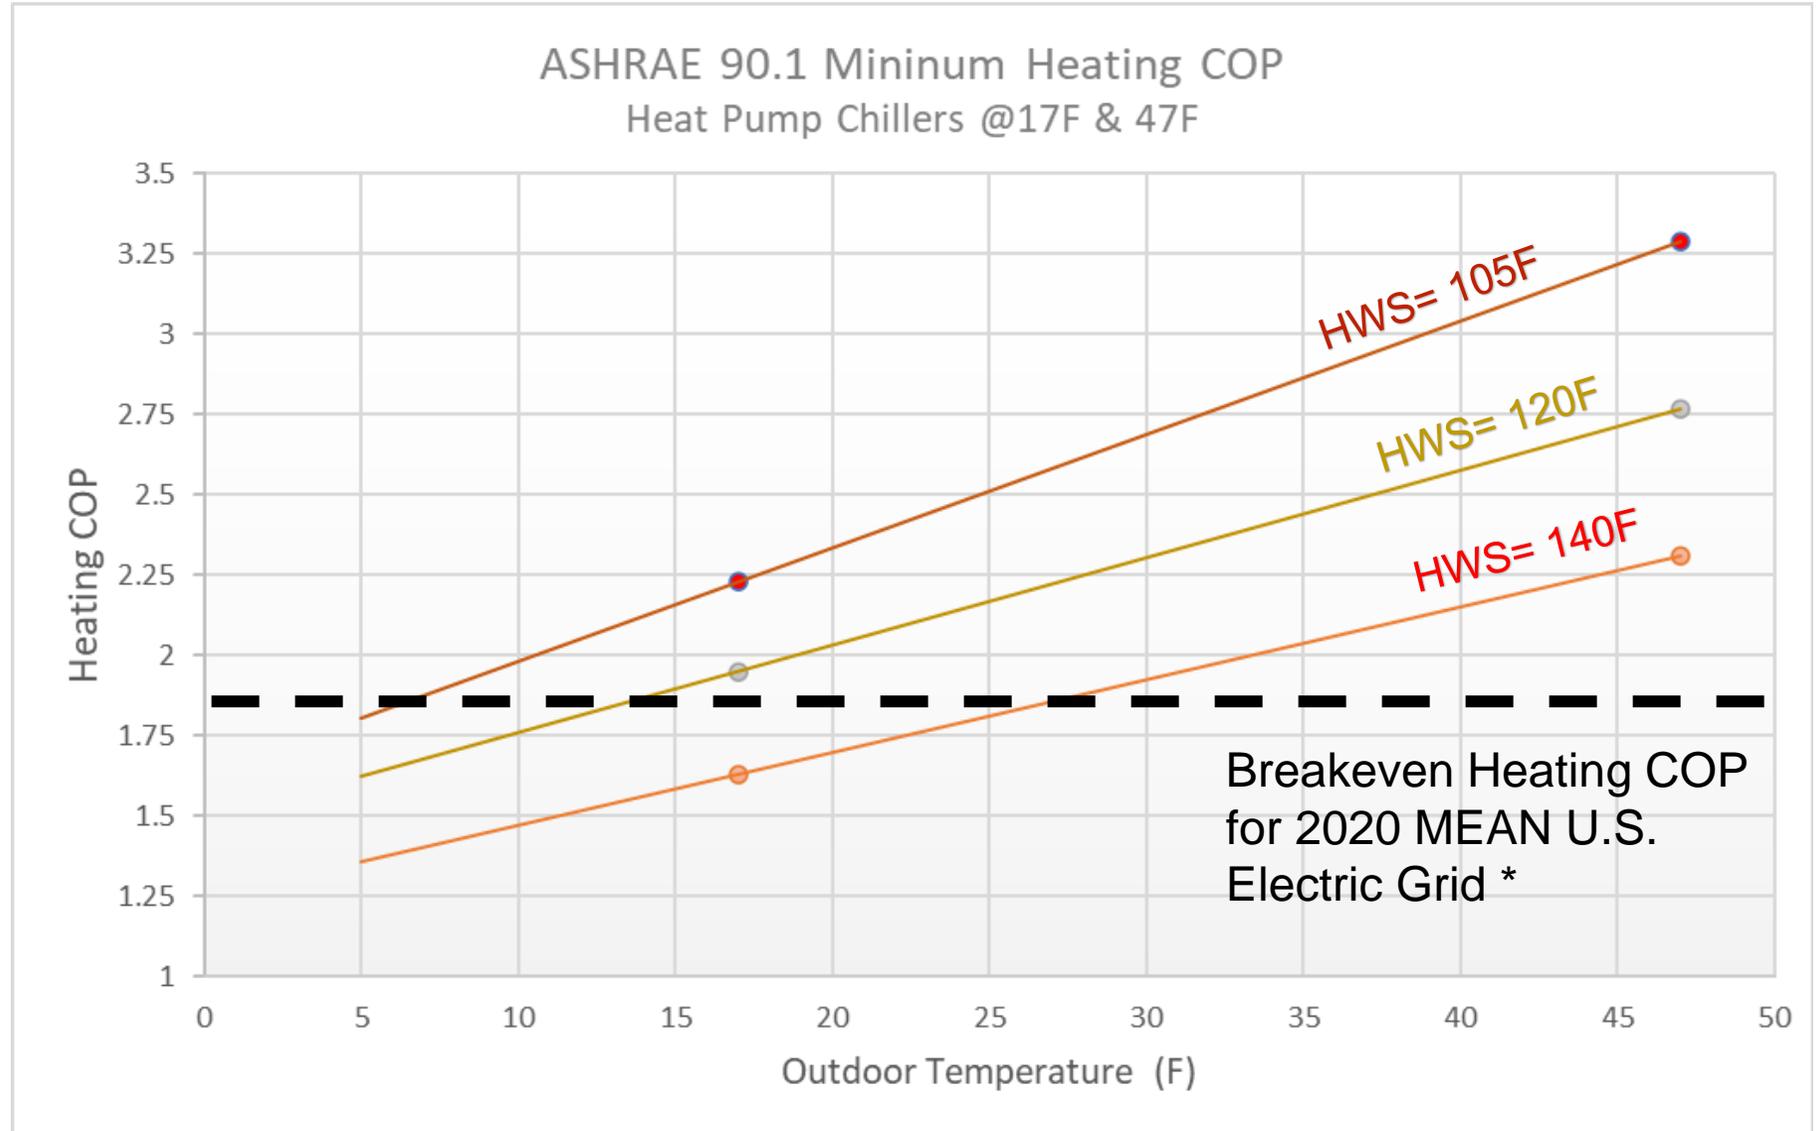

2020 Breakeven Heating COP Values

What Hot Water Supply Temperature to reduce Heating CO2 emissions? Full Load Minimum COPs

Hotter the water and/or “dirtier” the grid the more difficult it will be to reduce carbon footprint.

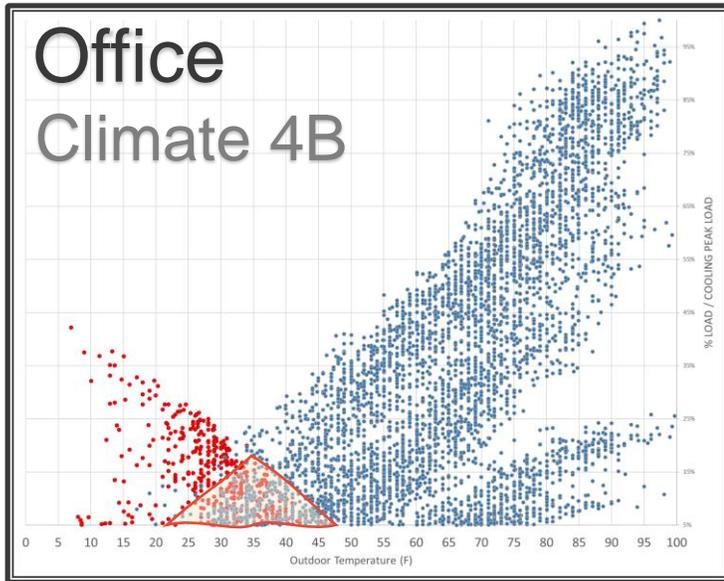

* Heat pump powered by 884lbCO₂e/MWh grid vs 90% eff Natural Gas hot water heater

Sizing Air to Water Heat Pumps

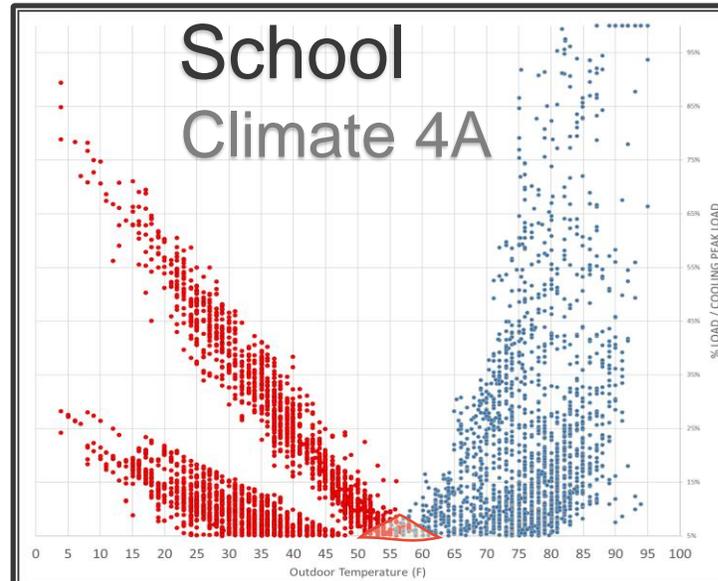

Ventilation Matters More Than Climate

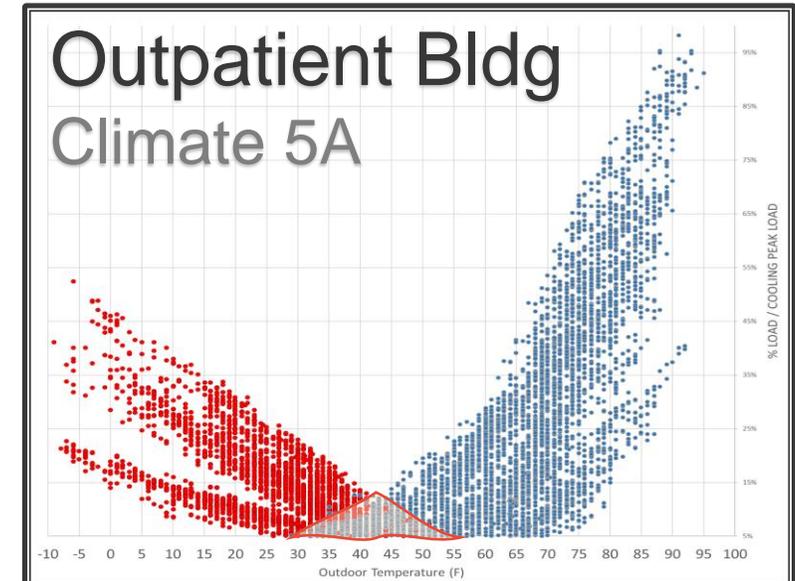

Lower Ventilation

Higher Ventilation

Mid Ventilation

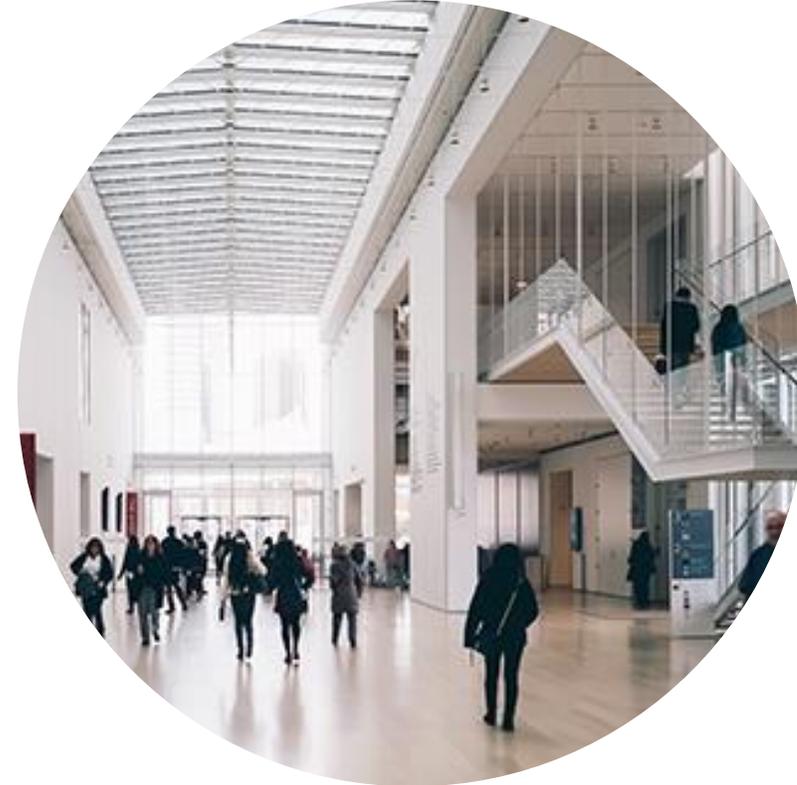

Simultaneous heating and cooling only occurs in shaded areas

Sizing Air to Water Heat Pumps

- Hours near peak heating are few
 - fewer even than near peak cooling!
- Higher the ventilation, the higher heating needs vs cooling and vice versa
- Unoccupied heating occurs many hours at lower capacity
- Hours of simultaneous heating and cooling are few and often during economizing times

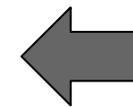

Sizing Heat Pumps for Peak Building Heating Load

Secondary Heat Sizing

Emergency Heat
Emergency Heat sized to protect building at 20-year, or 50-year extreme below 0°F

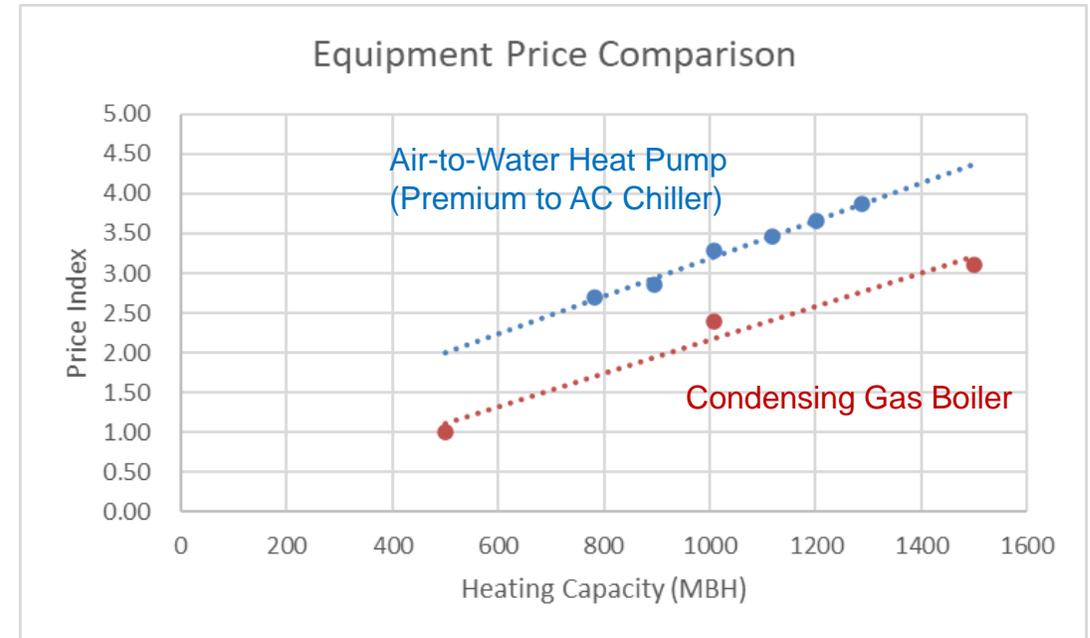

Auxiliary Heat
Auxiliary Heat sized to meet design loads in climates where normal operating conditions occur below 0°F

Trane® Study of ASHRAE® 90.1-2019 Basis Building Models

Oversizing Heating Can Be Costly

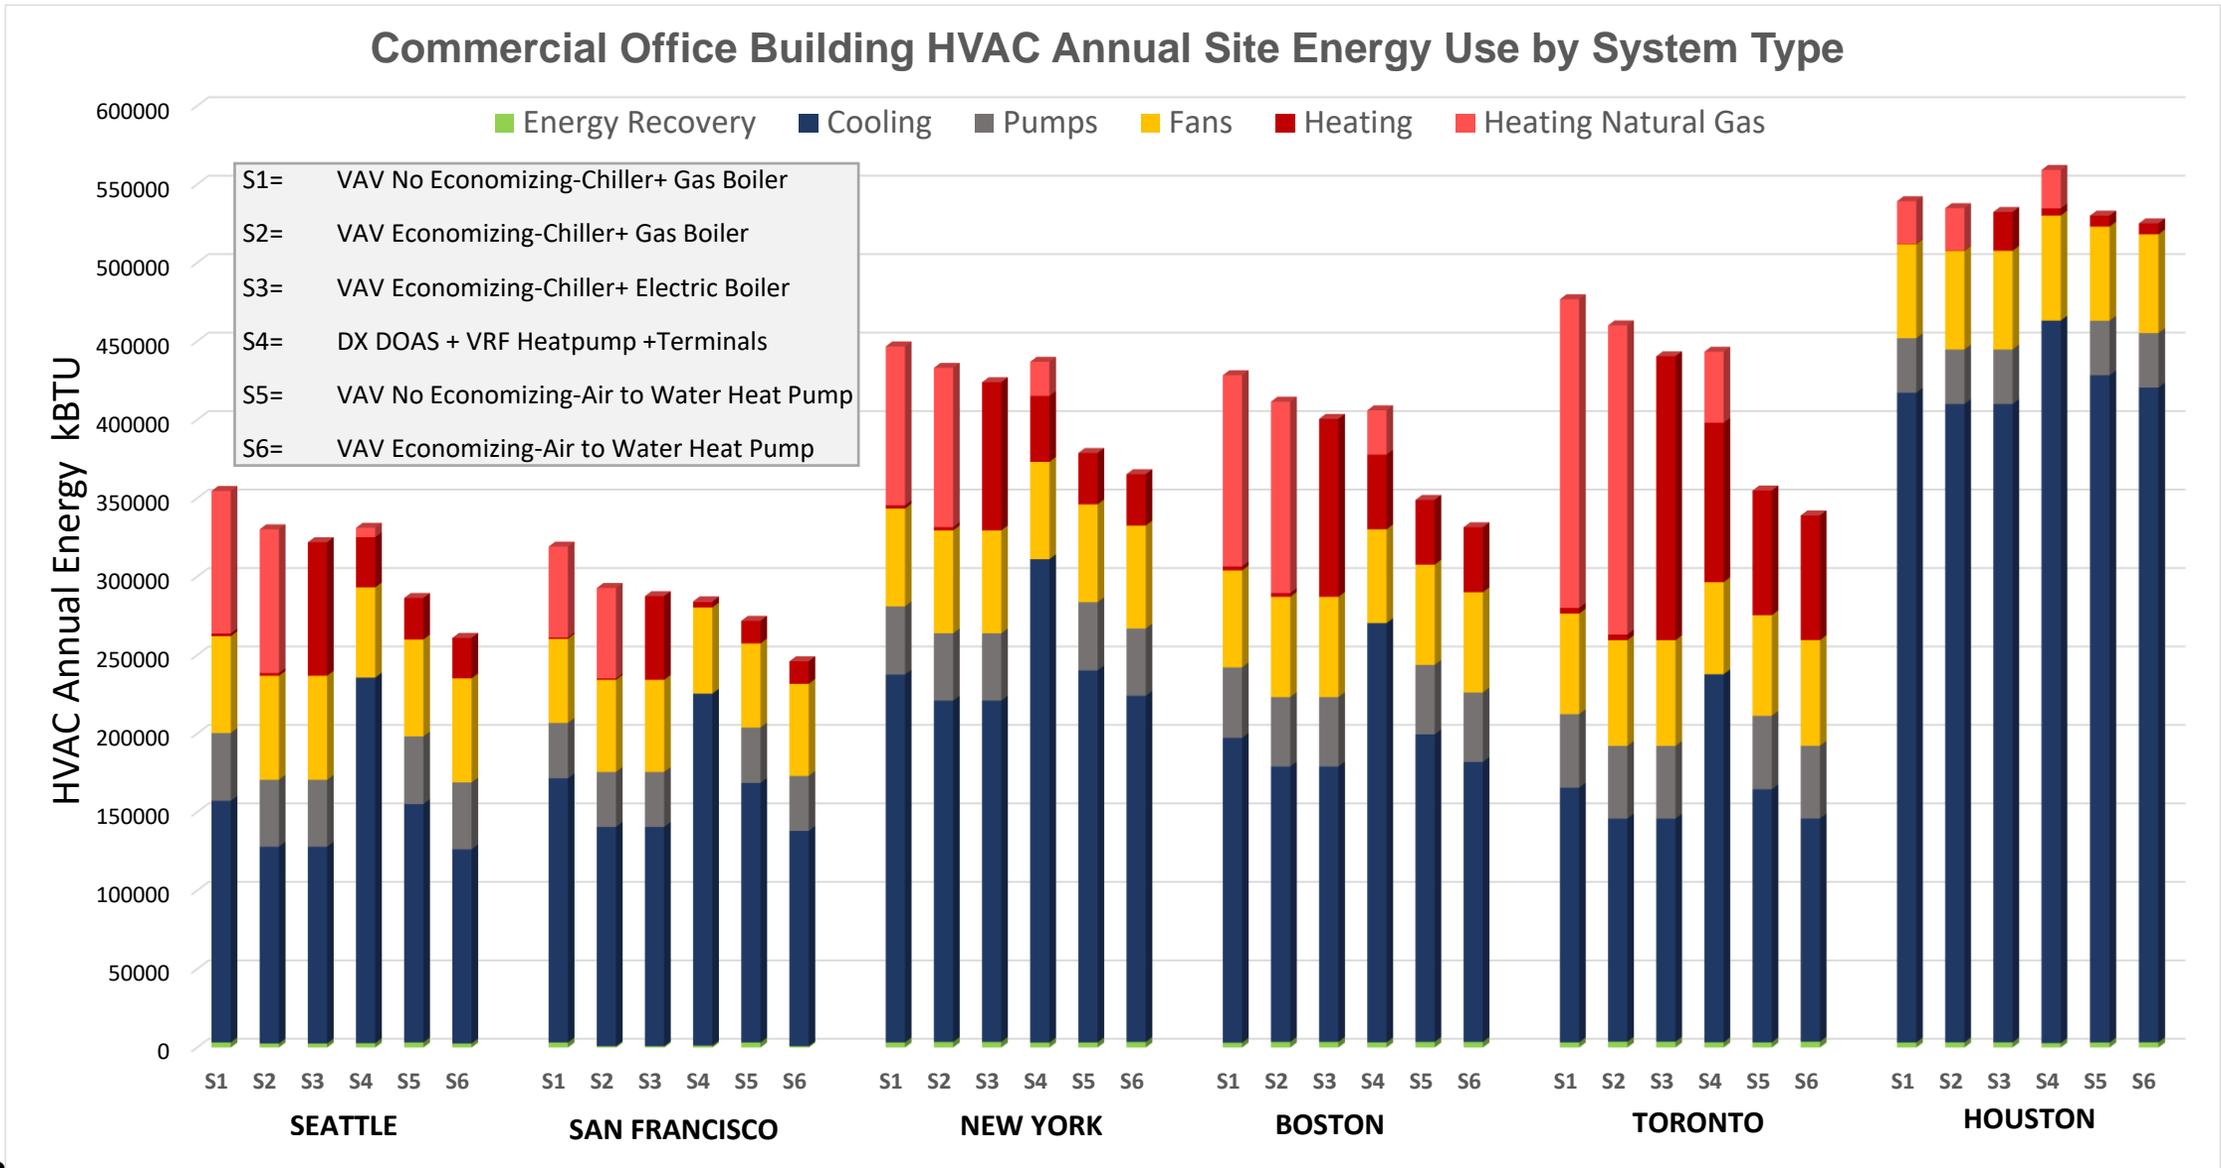

- Heating capacity is often oversized
 - Design practice not as focused or robust as cooling
 - All assumptions that go into heating design are ultra conservative
 - Don't account for internal heat generation
 - Not incorporate airside heat recovery in heating design
 - Optimizing cooling design resulting in oversized heating airflow (standardized heating SAT)
- Oversized equipment costs more, cycles more at low loads, and requires more refrigerant.

Applied Products

Update on hydronic heating portfolio

ASCEND[®] air-to-water heat pump model ACX

Capacity Range: 140 to 230 tons cooling, 1500 to 2500 MBh heating

Refrigerant: R-410A

Compressor design: scroll

Controls: Symbio[®] 800 with Adaptive Controls[™]

Factory-installed options: integrated pump & sound-reduction packages

Features and Benefits

- Ease support of electrification of heat
- Ease of installation
- Simplified service

Operating Limitations

Chilled Water	40 to 65F	0 to 125F Ambient
Hot Water	68 to 140F	0 to 95F Ambient

Max leaving at min ambient – 100F at 0F

Four-Pipe Distribution

Flexible Cooling and Heating

Four Pipe Production, Simultaneous Heating and Cooling

System Choices

Storage Source Heat Pump Cooling and Heating System

Key Ideas Regarding System Operation

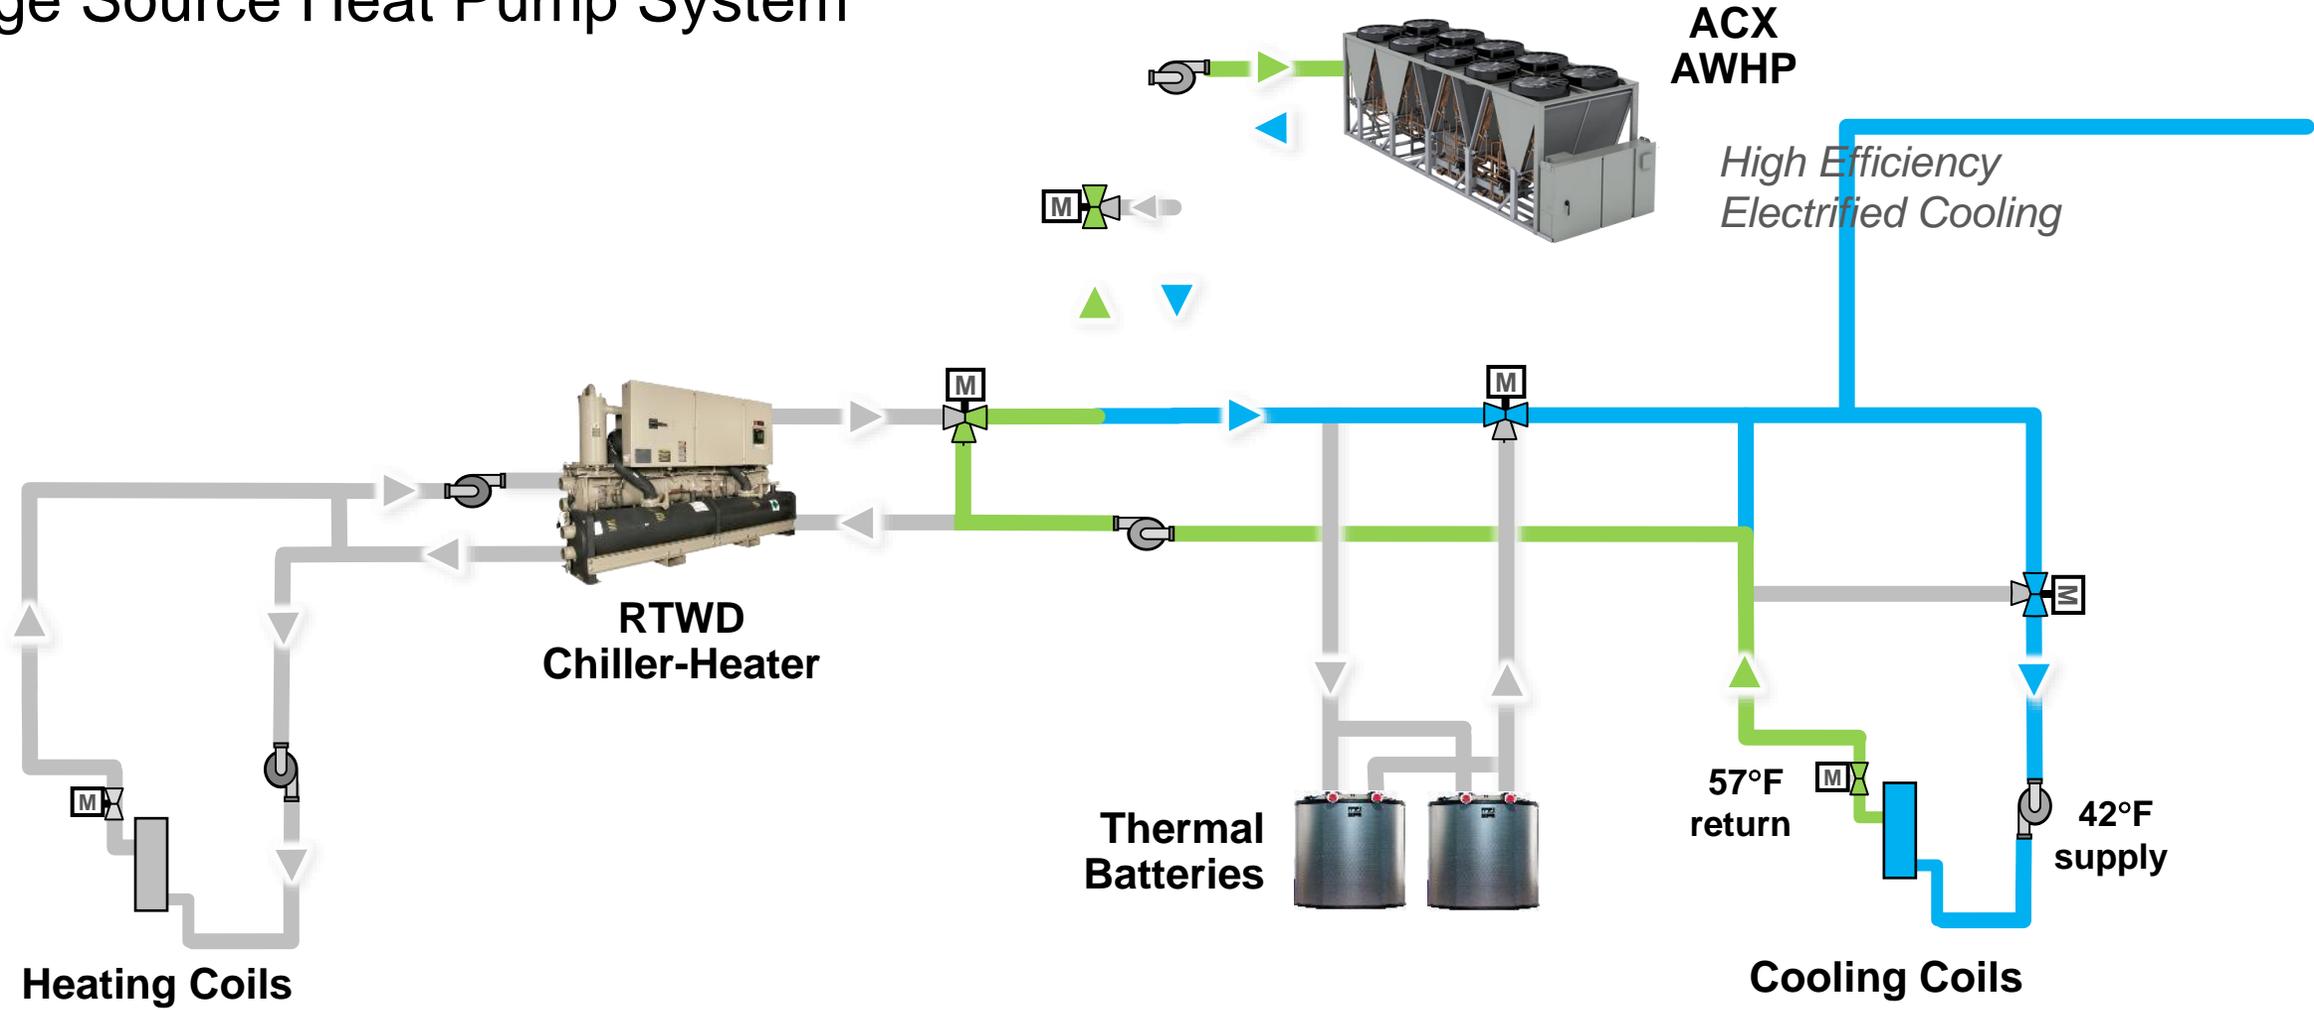

- Outdoor air is the primary source of building cooling and heating using the ACX AWHP.
- Calmac Thermal Storage Batteries collect or dispatch the net heat flow of all equipment and loads.
- ACX is able to “cool charge” (freeze water) or “heat charge” (melt ice) the Calmac Thermal Batteries when conditions are favorable.
- Calmac thermal batteries will directly cool the building (melt ice) to shift the electrical load and limit electrical demand in cooling season or to store building heat during heating season.
- RTWD units will be used for thermal battery source building heating (freezing water) during any outdoor conditions (even below 0F).
- Key benefits are:
 - Cold ambient electrified heating
 - Hot water supply capable (e.g. 130F) even when cold (below 0F)
 - Time independent heat recovery
 - AWHP downsizing
 - Enables demand management

Inflation Reduction Act
Overview

Inflation Reduction Act of 2022 (IRA)

Department of Energy

DOE Projects Monumental Emissions Reduction From Inflation Reduction Act

AUGUST 18, 2022

Energy.gov » DOE Projects Monumental Emissions Reduction From Inflation Reduction Act

Historic Legislation Supports Massive Clean Energy Buildouts, Rebates and Tax Credits to Slash Domestic Emissions up to 40%, Save Americans Hundreds of Dollars in Energy Costs a Year

WASHINGTON, D.C.—The U.S. Department of Energy (DOE) today released a fact sheet highlighting the Inflation Reduction Act's monumental support for clean energy technologies that will lower energy costs for families and businesses while helping drive 2030 economy-wide greenhouse gas (GHG) emissions to 40% below 2005 levels. The legislation will also bolster domestic manufacturing and provide direct investments for overburdened and underserved communities across America. This is the first report by the United States government analyzing how the Inflation Reduction Act can reduce GHG pollution.

Even more, the Act will lower energy costs for working families with rebates and tax incentives for home energy improvements, solar energy, and electric vehicles. The Inflation Reduction Act enhances President Biden's strong executive actions on climate change, state and local government actions, as well as the game-changing innovation currently being developed by American workers and businesses. Together with the President's Bipartisan Infrastructure Law, these transformative accomplishments will help position the U.S. to reach President Biden's goal of reducing greenhouse gas emissions 50-52% in 2030.

Source: [US Dept of Energy](https://www.energy.gov)

The White House @WhiteHouse

The Inflation Reduction Act will reduce greenhouse gas emissions by about a gigaton. That puts America on track to cut climate pollution by 40% and positions us to meet @POTUS' goal to cut that pollution in half by 2030.

4:30 PM · Aug 21, 2022 · The White House

IRA Incentives & Investments Impacts on the Commercial Market

~\$216B*

In **estimated** corporate **Tax Credits** designed to catalyze private investment in **clean energy**, transport, and manufacturing

*Source: [McKinsey & Company](#)

\$30.5B+

To **boost U.S. production to support building electrification**
(incl. energy storage & heat pumps)

\$30B

To transition states & electric utilities to clean electricity

\$3.42B

To **decarbonize federal buildings** through construction or retrofit

\$1B+

In grants for **local gov'ts to modernize commercial & residential buildings** to meet energy codes

\$50M+

To **reduce air pollutants in schools**

Updates to Energy Investment Tax Credit (48 ITC)

- Long-standing **tax credit** for **private** and **non-taxable** entities
- Historically for qualified “energy property,”
incl: solar, **geothermal heat pumps**, combined heat and power, and more

Key Changes from the IRA:

- **Tax credits of up to 50% of the cost** for energy property projects
- Expanded to addt'l technologies, incl. **thermal energy storage property** – defined as property comprising a system which:
 - (I) is directly connected to a **heating, ventilation, or air conditioning system**,
 - (II) removes heat from, or adds heat to, a **storage medium for subsequent use**, and
 - (III) provides energy for the heating/cooling of the interior of a **residential/commercial building**
- Timeframe base credit rates apply:
 - **Thermal energy storage: 12/31/2022-12/31/2024**
 - Geothermal heat pumps: phase out from 6%-4.4% from 12/31/2021-1/1/2035

Updated Energy Investment Tax Credit

Base Rate	6%
Increased Credit Amount*	Up to 30%
Meets Domestic Content Requirements**	2%-10%
Meets Energy Communities Requirements***	2%-10%
Total Potential Credit Value	Up to 6% Base + Up to 50% Bonus

*Increase Credit Amount: must meet prevailing wage and apprenticeship requirements **Domestic Content: i.e., materials are made in the USA

***Energy Communities: a brownfield site (as defined by the EPA); a community with above-average unemployment rate and 1) \$0.17 direct employment or 2) 25%+ local tax revenue from coal, oil or nat gas processes; census tracts containing mines and/or coal-fired generating units that have retired after 12/31/1999 or 12/31/2009 respectively

Source: full text of the legislation ([Link](#))

Updates to Energy Efficient Commercial Buildings Tax Deduction (179D)

- Long-standing **tax deduction** for building owners
 - **Expanded** for both **private & tax-exempt*** entities
- *Added inclusion allows specified “**tax-exempt entities**” that own buildings to “**allocate**” 179D deduction amounts to “the person primarily responsible for **designing the property** in lieu of the owner of such property.”
- Incentivizes commercial owners who **retrofit** or **newly construct** facilities to be energy efficient
 - Increased deduction **up to \$5/sq.ft.**
 - **Reduced** improved efficiency threshold to **25%**
 - **Alternative deduction** for energy efficient **retrofit** property allows comparison to **baseline energy use intensity**
 - **3-year cap** (vs previous lifetime), allowing for **multiple projects over time**

Notable Criteria to Reach Maximum

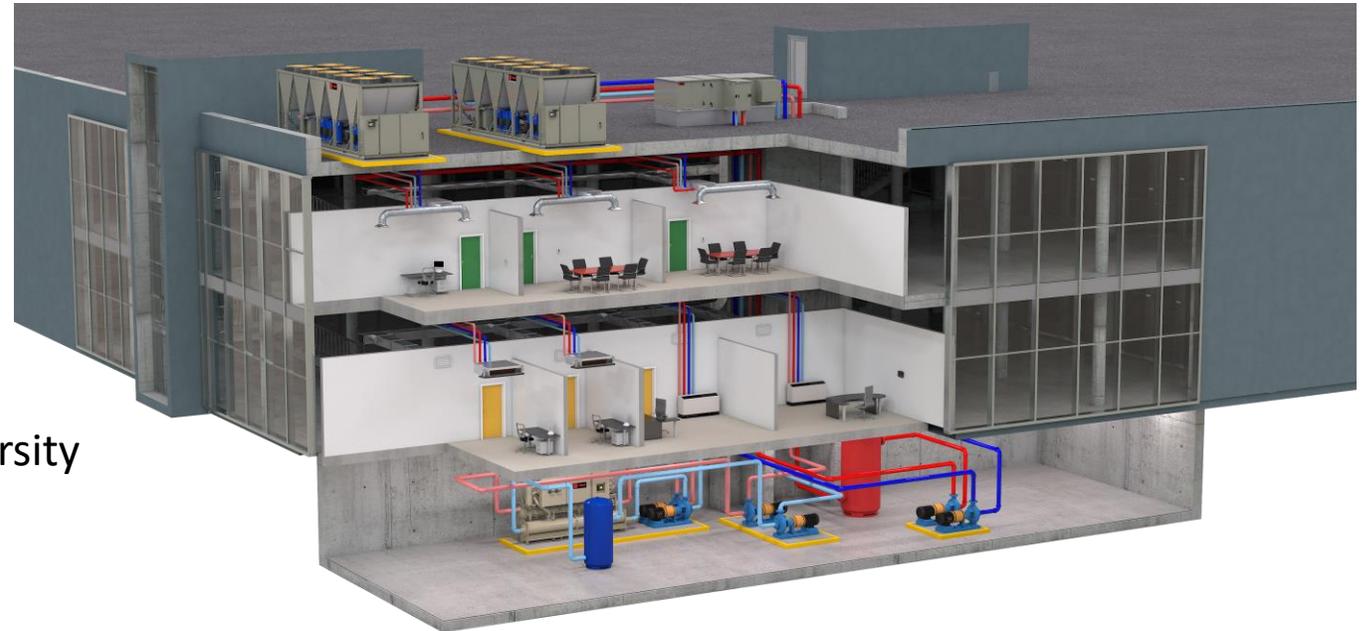

- ✓ Qualifying property must:
 - Be within scope of ASHRAE 90.1
 - Be in service after 12/31/2022
- ✓ Qualifying improvements incl: **HVAC & hot water systems**, building envelope, **interior lighting**, and more
- ✓ Bonus deduction - must meet prevailing wages and apprenticeship requirements*
- ✓ Retrofit buildings must be in service 5+ years to qualify for alternative deduction path

Efficiency Gain Over Baseline	Base Deduction Rate	Bonus Deduction Rate*
25% (min)	\$0.50 / sq.ft.	\$2.50 / sq.ft.
30%	\$0.60 / sq.ft.	\$3.00 / sq.ft.
35%	\$0.70 / sq.ft.	\$3.50 / sq.ft.
40%	\$0.80 / sq.ft.	\$4.00 / sq.ft.
50% (max)	\$1.00 / sq.ft.	\$5.00 / sq.ft.

Chiller Heater Systems are Airside Flexible

- Applied to all airside systems
 - Multiple zone VAV systems
 - Fan coil systems
 - Central air handling systems
 - Single zone VAV systems
 - Sensible cooling systems
 - Any combination
- Benefits of this flexibility
 - Air economizer
 - Downsize capacity with whole building diversity
 - One integrated backup heating system
 - DOAS can heat 0F to 60F air directly

Summary

- Heat pumps move heat, they don't create heat
- Heat pumps can successfully meet comfort applications
- Required hot water temperature is determined by the load and the available heat exchangers
- Reduced carbon emissions will increasingly influence our thinking and decision making
- Trane has a growing heating products and system offering
- Hydronic heat pump systems offer airside system flexibility
